Some of the USFWS offices maintain a database of listed species within their jurisdiction, for example the Sacramento[4] and Carlsbad[5] offices. The Carlsbad USFWS Office jurisdiction encompasses the counties of Los Angeles, Orange, Riverside, San Bernardino, Imperial, and San Diego.

4.7.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) protects individuals as well as any part, nest, or eggs of any bird listed as migratory. In practice, Federal permits issued for activities that potentially

4 http://www.fws.gov/sacramento/ES_Species/Lists/es_species_lists-overview.htm
5 http://www.fws.gov/carlsbad/SpeciesStatusList/CFWO_Species_Status_List.htm

impact migratory birds typically have conditions that require pre-disturbance surveys for nesting birds. In the event nesting is observed, a buffer area with a specified radius must be established, within which no disturbance or intrusion is allowed until the young have fledged and left the nest, or it has been determined that the nest has failed. If not otherwise specified in the permit, the size of the buffer area varies with species and local circumstances (e.g., presence of busy roads, intervening topography, etc.), and is based on the professional judgment of a monitoring biologist. A list of migratory bird species protected under the MBTA is published by USFWS.

4.7.1.3 Federal Clean Water Act, Section 404

Section 404 of the Clean Water Act (CWA) regulates the discharge of dredged or fill material into waters of the U.S. and authorizes the Secretary of the Army, through the Chief of Engineers, to issue permits for such actions. Implementing regulations for the CWA define waters of the U.S. as "rivers, creeks, streams, and lakes extending to their headwaters and any associated wetlands." Wetlands are defined as "areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions." The permit review process entails an assessment of potentially adverse impacts to USACE jurisdictional waters of the U.S.

Over the years, the USACE has modified its regulations, typically due to evolving policy or judicial decisions, through the issuance of Regulatory Guidance Letters, memorandums, or more expansive instruction guidebooks. These guidance documents help to update and define how jurisdiction is claimed, and how these waters of the U.S. will be regulated. The most recent, significant modification occurred on June 5, 2007, subsequently updated in December 2008, when the USACE and the U.S. Environmental Protection Agency (USEPA) issued a series of guidance documents outlining the requirements and procedures, effective immediately, to establish jurisdiction under Section 404 of the CWA and the Section 10 of the Rivers and Harbors Act of 1899. These documents are intended to be used for all jurisdictional delineations and provide specific guidance for the jurisdictional determination of potentially jurisdictional features affected by the U.S. Supreme Court rulings in *Rapanos v. the United States* and *Carabell v. the United States* 547 U.S. 715 (2006) (jointly referred to as *Rapanos*).

The *Rapanos* case outlines the conditions and criteria used by the USACE to assess and claim jurisdiction over non-isolated, non-navigable, ephemeral tributaries. Under a plurality ruling, the Court noted that certain "not relatively permanent" (i.e., ephemeral), non-navigable tributaries must have a "significant nexus" to downstream traditional navigable waters to be jurisdictional. An ephemeral tributary has a significant nexus to downstream navigable "waters" when it has "more than a speculative or an insubstantial effect on the chemical, physical, and/or biological integrity of a Traditional Navigable Water (TNW)." A significant nexus is established through the consideration of a variety of hydrologic, geologic and ecological factors specific to the particular drainage feature in question. For drainage features that do not meet the significant nexus criteria, a significant nexus determination is provided by the USACE to the USEPA for the final determination of federal jurisdiction. Drainage features that do not meet the significant nexus criteria based on completion of an AJD, and/or are determined to be isolated pursuant to the SWANCC ruling (see below), may still be regulated by California Department of Fish and

Wildlife (CDFW) under Fish and Game Code Section 1600 or the Regional Water Quality Control Board (RWQCB) under the Porter-Cologne Water Quality Act.

On January 15, 2003, the USACE and USEPA issued a Joint Memorandum to provide clarifying guidance regarding the United States Supreme Court ruling in the *Solid Waste Agency of Northern Cook County v. United States Army Corps of Engineers*, No. 99-1178 (January 9, 2001) ("the SWANCC ruling"), (Federal Register: Vol. 68, No. 10.). This ruling held that the CWA does not give the federal government regulatory authority over non-navigable, isolated, intrastate waters. As a result of this decision, some previously regulated depressional areas such as mudflats, sandflats, wetlands, prairie potholes, wet meadows, playa lakes, natural ponds, and vernal pools, which are not hydrologically connected to other intra- or inter-state "waters of the U.S.," are no longer regulated by the USACE.

4.7.1.4 Federal Clean Water Act, Section 401

The mission of the RWQCB is to develop and enforce water quality objectives and implement plans that will best protect the beneficial uses of the state's waters, recognizing local differences in climate, topography, geology, and hydrology. The California RWQCB is responsible for implementing compliance not only with state codes such as the California Water Code, but also some federal acts such as Section 401 of the CWA. Section 401 of the CWA requires that any applicant for a federal permit for activities that involve a discharge to waters of the state shall provide the federal permitting agency with a certification from the state in which the discharge is proposed that states that the discharge will comply with the applicable provisions under the federal CWA.[6] As such, before the USACE will issue a CWA Section 404 permit, applicants must apply for and receive a Section 401 water quality certification (WQC) from the RWQCB. The RWQCB regulates "discharging waste, or proposing to discharge waste, within any region that could affect "waters of the state" (Water Code § 13260 (a)), pursuant to provisions of the Porter-Cologne Water Quality Control Act which defines RWQCB jurisdictional "waters of the state" as "any surface water or groundwater, including saline waters, within the boundaries of the state" (Water Code § 13050 (e)).

With the exception of isolated waters and wetlands, most discharges of fill to waters of the state are also subject to a CWA Section 404 permit. If a CWA Section 404 permit is not required for the project, the RWQCB may still require issuance of Waste Discharge Requirements (WDR) under the Porter-Cologne Water Quality Control Act. The RWQCB may regulate isolated waters that are not under jurisdiction of the USACE through issuance of WDR's. However, projects that obtain a Section 401 WQC are simultaneously enrolled in a statewide general WDR. Processing of Section 401 WQC's generally requires submittal of 1) a construction storm water pollution prevention plan (SWPPP), 2) a final water quality technical report that demonstrates that post-construction storm water Best Management Practices (BMPs) comply with the local design standards for municipal storm drain permits (MS4 permits) implemented by the State Water Resources Control Board effective January 1, 2011, and 3) a conceptual Habitat Mitigation and Monitoring Plan (HMMP) to compensate for permanent impacts to RWQCB waters, if any. In

6 33 USC 1341 *(a) (1)*.

addition to submittal of a draft CEQA document, a WQC application typically requires a discussion of avoidance and minimization of impacts to RWQCB jurisdictional resources, and efforts to protect beneficial uses as defined by the local RWQCB basin plan for the project. The RWQCB cannot issue a Section 401 WQC until the project CEQA document is certified by the lead agency.

4.7.2 State of California Special-status Resource Protection and Classifications

4.7.2.1 CESA

California's Endangered Species Act (CESA) defines an endangered species as:

> *…a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease.*

The State defines a threatened species as:

> *…a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the commission as rare on or before January 1, 1985 is a threatened species.*

Candidate species are defined as:

> *…a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the commission has published a notice of proposed regulation to add the species to either list.*

Candidate species may be afforded temporary protection as though they were already listed as threatened or endangered at the discretion of the Fish and Wildlife Commission. Unlike the FESA, CESA does not include listing provisions for invertebrate species.

Article 3, Sections 2080 through 2085, of the CESA addresses the taking of threatened or endangered species by stating:

> *…no person shall import into this State, export out of this State, or take, possess, purchase, or sell within this State, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts, except as otherwise provided.*

Under the CESA, "take" is defined as, "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

Additionally, some special-status mammals and birds are protected by the State as Fully Protected Mammals or Fully Protected Birds, as described in the California Fish and Wildlife Code, Sections 4700 and 3511, respectively.

California Species of Special Concern are species designated as vulnerable to extinction due to declining population levels, limited ranges, and/or continuing threats. Informally listed species are not protected per se, but warrant consideration in the preparation of biological assessments. For some species, the CNDDB is only concerned with specific portions of the life history, such as roosts, rookeries, or nest areas.

For the purposes of this BRA, the following acronyms are used for State status species, as applicable:

- SE State-listed as Endangered
- ST State-listed as Threatened
- SR State-listed as Rare
- SCE State candidate for listing as Endangered
- SCT State candidate for listing as Threatened
- SFP State Fully Protected
- SSC California Species of Special Concern

Protection of Birds

Section 3503.5 of the California Fish and Game Code states that it is "unlawful to take, possess, or destroy any birds in the order Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto." Activities that result in the abandonment of an active bird of prey nest may also be considered in violation of this code. In addition, California Fish and Game Code, Section 3511 prohibits the taking of any bird listed as fully protected, and California Fish and Game Code, Section 3515 states that is it unlawful to take any non-game migratory bird protected under the MBTA.

4.7.2.2 State of California Fish and Game Code, Section 1602

Section 1602 of the California Fish and Game Code requires any entity (e.g., person, state or local government agency, or public utility) who proposes a project that will substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake to notify the CDFW of the proposed project. In the course of this notification process, the CDFW will review the proposed project as it affects streambed habitats within the project area. The CDFW may then place conditions in the Section 1602 Streambed Alteration Agreement to avoid, minimize, and mitigate any potentially significant adverse impacts within CDFW jurisdictional limits.

4.7.2.3 California Native Plant Society

The CNPS is a private plant conservation organization dedicated to the monitoring and protection of special-status species in California. CNPS has compiled an inventory comprised of the information focusing on geographic distribution and qualitative characterization of Rare, Threatened, or Endangered vascular plant species of California (CNPS 2012). The list serves as the candidate list for listing as Threatened and Endangered by CDFW. CNPS has developed five categories of rarity, of which Ranks 1A, 1B, and 2 are particularly considered special-status:

- Rank 1A Presumed extinct in California.
- Rank 1B Plants Rare, Threatened, or Endangered in California and elsewhere.
- Rank 2 Plants Rare, Threatened, or Endangered in California, but more common elsewhere.
- Rank 3 Plants about which we need more information – a review list.
- Rank 4 Plants of limited distribution – a watch list.

The CNPS recently added "threat ranks" which parallel the ranks used by the CNDDB. These ranks are added as a decimal code after the CNPS List (e.g., Rank 1B.1). The threat codes are as follows:

- .1 – Seriously endangered in California (over 80% of occurrences threatened/high degree and immediacy of threat);
- .2 – Fairly endangered in California (20-80% occurrences threatened);
- .3 – Not very endangered in California (<20% of occurrences threatened or no current threats known).

Special-status species that occur or potentially could occur within the study area is based on one or more of the following: (1) the direct observation of the species within the study area during any field surveys; (2) a record reported in the CNDDB; and (3) the study area is within known distribution of a species and contains appropriate habitat.

4.7.2.4 Sensitive Plant Communities

Sensitive plant communities include those habitat types considered rare by resource agencies, namely the CDFW, due to their scarcity and/or their ability to support State and Federally-listed Endangered, Threatened, and Rare vascular plants, as well as several special-status bird and reptile species. CDFW maintains a natural plant community list, the *List of California Terrestrial Natural Communities*.[7] Special-status natural communities (also referred to by CDFW as 'rare' or 'special concern') are identified on the list by an asterisk and are considered high priority vegetation types (CDFW, 2010; CDFW, 2000a).

7 Available online at: http://www.dfg.ca.gov/biogeodata/vegcamp/natural_comm_list.asp.

4.7.3 Local Special-status Resource Protection and Classifications

Western Riverside County MSHCP

The study area is within the Western Riverside County MSHCP which was adopted by the Riverside County Board of Supervisors (June 17, 2003). The MSHCP functions as an Habitat Conservation Plan (HCP) pursuant to Section 10(a)(1)(B) of the FESA and as a Natural Communities Conservation Plan (NCCP) under the NCCP Act of 2001. The USFWS and CDFW have authorized the take of a number special-status plant and wildlife species (Covered Species) within the MSHCP Plan Area in exchange for the assembly and management of a coordinated MSHCP Conservation Area.

Stephens' Kangaroo Rat Habitat Conservation Plan

The Stephens' kangaroo rat (SKR) HCP provides Take Authorization for SKR within its boundaries as implemented by legal agreements executed among the Riverside County Habitat Conservation Agency (RCHCA), its member agencies, USFWS, CDFW, BLM , U.S. Department of Interior, State of California Resources Agency, and other agencies as appropriate.[8] The MSHCP provides Take Authorization for SKR outside the boundaries of the SKR HCP, but within the MSHCP Plan Area boundaries. The seven core reserves established by the SKR HCP will be managed as part of the MSHCP Conservation Area consistent with the SKR HCP.

The study area is within the boundaries of the SKR HCP but is not within any of the core reserves. As such, the project would be required to pay a SKR mitigation fee for coverage under the SKR HCP.

4.7.4 Sensitive Plant Communities

The study area does not support any communities considered by CDFW as sensitive habitats.

4.7.5 Special-status Plant Species

Special-status plants include those listed, or candidates for listing, by the USFWS and CDFW; and species considered special-status by the CNPS (particularly Lists 1A, 1B, and 2). Several special-status plant species were reported in the vicinity based on CNDDB and CNPS, totaling 65 species within the 9-quadrangle search (as indicated in **Appendix B**, *Special-Status Plant Species*). A total of 12 species were identified as having a potential to occur within the study area based on the literature review and existing habitat on the study area, as listed in Appendix B. Focused plant surveys were conducted in 2015 on the project site and off-site road improvement and sewer line areas and in 2016 on the off-site water line areas; none of the species determined to have a potential to occur on the project site and off-site water and sewer line areas were observed. A summer focused survey was conducted within the off-site eastern manufactured slope area in 2016; however, a spring survey has not yet been conducted within this area. The western manufactured slope areas do not support suitable habitat for special-status plant species.

8 *http://www.skrplan.org/index.html*

4.7.6 Special-status Wildlife Species

Special-status wildlife include those species listed as Endangered or Threatened under the FESA or CESA, candidates for listing by the USFWS or CDFW, and species of special concern to the CDFW. Several special-status wildlife species were reported in the vicinity based on CNDDB, totaling 43 species within the 9-quadrangle search. A total of 19 species were identified as having a potential to occur within or use the study area based on the literature review and habitat present on the study area, as listed in **Appendix C**, *Special-status Wildlife Species*.

In addition, focused surveys were conducted for the burrowing owl in accordance with recommended protocols and the potential for foraging and nesting migratory bird and raptor species were also analyzed due to known presence within the study area or within the vicinity (see Appendix C). The species with a potential to occur on the study area are discussed below, including the results of the burrowing owl surveys and the migratory birds and raptors assessment.

Species With Potential to Occur On-site

Coast horned lizard (*Phrynosoma blainvillii*): This reptile species is a state species of special concern and is a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers sandy riparian and sage scrub habitats, but also occurs in valley-foothill, hardwood, conifer, pine-cypress, juniper and annual grassland habitats below 6,000 feet. Habitats include open country, especially sandy areas, washes, flood plains, and windblown deposits.

Coast horned lizard was determined to have a moderate potential to occur within the study area based on the presence of some potentially suitable habitat on the northwestern corner of the on-site area, which includes Riversidean sage scrub and brittlebush scrub. Harvester ants, this species main food source, were also observed (although the food source was not seen in the area supporting suitable habitat). Although habitat and a food source potentially exist on the study area, the majority of the potentially suitable habitat is disturbed and higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the study area. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Orange-throated whiptail (*Aspidoscelis hyperythra*): This reptile species is a state species of special concern and a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers chaparral, non-native grassland, Riversidean sage scrub, and juniper and oak woodlands. It is often associated with riparian areas and alluvial fan sage scrub habitats.

Orange-throated whiptail was determined to have a moderate potential to occur within the study area based on the presence of some potentially suitable habitat on the northwestern corner of the on-site area, which includes Riversidean sage scrub and brittlebush scrub. These areas support perennial plants that may host this species preferred food source (termites). Although habitat and a food source potentially exist on the study area, the majority of the potentially suitable habitat is disturbed and higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the study area. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Red Diamond Rattlesnake (*Crotalus ruber*): This reptile species is a state species of special concern and a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers chaparral, woodland, and arid desert habitats in rocky areas with dense vegetation.

Red diamond rattlesnake was determined to have a moderate potential to occur within the study area based on the presence of some potentially suitable habitat on the northwestern corner of the on-site area, which includes Riversidean sage scrub and brittlebush scrub. Although these areas support some vegetation and crevices within the rock outcrops, the vegetation is not dense and rock crevices available for cover are limited. Higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the study area. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Golden Eagle (*Aquila chrysaetos*): This raptor is a state fully protected species and is protected by the Bald and Golden Eagle Protection Act; it is also a Covered Species pursuant to the Western Riverside County MSHCP. This species nests on cliff faces and tall trees. Foraging habitat includes open country, including grasslands and early successional stages of forest and shrub habitats.

Golden eagle was determined to have a potential to occur only to forage within the study area based on the presence of a few fossorial mammal burrows within the disturbed areas on-site, suggesting the presence of small mammals that could provide a possible food source. However, the potential for foraging was considered very low since the majority of the site is surrounded by development and is highly disturbed, making it a less optimal habitat. This species is not expected to nest due to lack of cliffs on the study area, which is their preferred nesting habitat. Additionally, there is only one CNDDB occurrence record within the vicinity. This record was a breeding pair observed in fall 1979, spring 1980, and fall 1980 in San Timoteo Canyon, approximately 6.0 miles to the northeast. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Swainson's hawk (*Buteo swainsoni*): This bird species is listed as threatened by the state and is a Covered Species pursuant to the Western Riverside County MSHCP. It prefers Great Basin grasslands, riparian forests, riparian woodlands, and valley and foothill grasslands.

Swainson's hawk was determined to have a potential for foraging only within the study area based on the presence of a few fossorial mammal burrows within the disturbed areas on-site, suggesting the presence of small mammals that could provide a possible food source. However, the potential for foraging was considered low since the majority of the site is surrounded by development and is highly disturbed, making it a less optimal habitat. This species is not expected to nest due to the limited number of trees on the study area and the proximity of the trees to roads and residential homes, which could create some noise disturbance. Additionally, there are only two CNDDB occurrence records of nesting individuals within the vicinity; both records are from over 100 years ago. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Burrowing owl: This bird species is a state species of special concern and a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers coastal prairie, coastal scrub, Great Basin scrub, Mojavean desert scrub, Sonoran desert scrub, valley and foothill grassland and disturbed habitats. It is known to occur in the project vicinity based on CNDDB and the MSHCP, and the study area is within the MSHCP Burrowing Owl Survey Area, an overlay in the MSHCP that requires additional surveys.

Burrowing owl was determined to have potential to occur within the study area based on the presence of suitable habitat that was identified during the Step I survey, including disturbed, low-growing vegetation, bare ground, and a few small fossorial mammal burrows. Step II surveys were conducted from May to July 2015 within the project site and off-site manufactured slopes, road improvement, proposed water line, and sewer line areas. Step II surveys were conducted from April to July 2016 within the off-site alternative water line areas. The subsequent Step II surveys did not identify individual burrowing owls, active burrowing owl burrows, or signs of burrowing owls within the survey area. Therefore, the study area and adjacent buffer area do not currently support burrowing owls. The results are also outlined in a separate survey reports attached as **Appendix D**, 2015 *Burrowing Owl Focused Survey Report* and **Appendix E**, 2016 *Burrowing Owl Focused Survey Report*.

Loggerhead shrike (*Lanius ludovicianus*): This bird species is listed as a state species of special concern and a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers broadleaved upland forest, desert wash, Joshua tree woodland, Mojavean desert scrub, pinyon and juniper woodlands, riparian woodland, and Sonoran desert scrub habitats.

Loggerhead shrike was observed foraging within the northwestern corner of study area during the third burrowing owl survey conducted on July 2, 2015. This area supports suitable foraging habitat for this species, which includes Riversidean sage scrub and brittlebush scrub. The potential for nesting for this species is considered moderate based on the presence of shrubs on the northwestern corner. Although this area supports shrubs that may be suitable for nesting, the northwestern corner is adjacent to developed, residential areas; higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the study area.

Coastal California gnatcatcher (*Polioptila californica californica*): This bird species is listed as Federally Threatened, state species of special concern, and a Covered Species pursuant to the Western Riverside County MSHCP. This species is an obligate inhabitant of coastal sage scrub habitat.

This species was observed on the study area during the focused burrowing owl survey conducted on May 13, 2015. Only one individual was heard during the survey.

Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*): This mammal species is listed as a state species of special concern and a Covered Species pursuant to the Western

Riverside County MSHCP. It prefers chaparral and coastal sage scrub habitats, in addition to grassland and Riversidean alluvial fan sage scrub habitats.

Northwestern San Diego pocket mouse was determined to have a moderate potential to occur within the study area based on the presence of suitable coastal scrub and chaparral habitat (e.g. brittle bush scrub, Riversidean sage scrub) in the northwestern portion and small fossorial mammal burrows. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Stephens' kangaroo rat (*Dipodomys stephensi*): This mammal species is listed as federally endangered and state threatened. Take Authorization for Stephens' kangaroo rat is provided by the SKR HCP within its plan boundaries, and by the Western Riverside County MSHCP for areas outside of the SKR HCP but within the MSHCP area plan boundaries (this species is a MSHCP Covered Species). This species prefers open grasslands or sparse shrub lands within sandy to sandy loam soils and low clay and gravel content.

Stephens' kangaroo rat was determined to have a moderate potential to occur within the study area based on the presence of suitable shrub habitat (e.g. brittle bush scrub, Riversidean sage scrub) in the northwestern portion and small fossorial mammal burrows. The study area is not within any core reserves identified by the SKR HCP. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Los Angeles pocket mouse (*Perognathus longimembris brevinasus*): This mammal species is listed as a state species of special concern and a conditionally Covered Species pursuant to the Western Riverside County MSHCP (surveys are required for areas within the survey overlay, with potential conservation). It prefers sparsely vegetated habitat areas within coastal sage scrub communities and in patches of fine sandy soils associated with washes.

Los Angeles pocket mouse was determined to have a moderate potential to occur within the study area based on the presence of suitable Riversidean sage scrub habitat in the northwestern portion. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

San Diego black-tailed jackrabbit (*Lepus californicus bennettii*): This mammal species is a California Species of Special Concern and a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers open brushlands and scrub habitats.

San Diego black-tailed jackrabbit was determined to have a moderate potential to occur within the study area. The majority of the study area supports suitable habitat for this species, including the Riversidean sage scrub on the northwestern corner and the ruderal areas (which support some short grasses). However, this species is highly conspicuous and no incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

San Diego desert woodrat: This mammal species is a California Species of Special Concern and a Covered Species pursuant to the Western Riverside County MSHCP. This species prefers coastal scrub and chaparral habitats with areas containing rock outcrops and cliffs.

San Diego desert woodrat was determined to have a moderate potential to occur within the study area based on the presence of suitable habitat (e.g. Riversidean sage scrub, rock outcrop/Riversidean sage scrub) in the northwestern portion and small fossorial mammal burrows. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Southern Grasshopper Mouse (*Onychomys torridus ramona*): This mammal species is a state species of special concern. This species prefers grasslands, desert areas, and especially scrub with friable soils.

Southern grasshopper mouse was determined to have a potential to occur within the study area based on the presence of suitable shrub habitat (e.g. brittle bush scrub and Riversidean sage scrub) in the northwestern portion and small fossorial mammal burrows. However, the potential was considered low since this species has not been recorded on CNDDB within the vicinity of study area since 1938. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

American badger (*Taxidea taxus*): This mammal species is a state species of special concern. This species prefers grasslands, desert areas, and especially scrub with friable soils.

American badger was determined to have a potential to occur within the study area based on the presence of shrubs within the Riversidean sage scrub habitat on the northwestern corner of the study area. A few fossorial mammal burrows were observed, suggesting the presence of small mammals that could provide a possible food source. However, the potential was considered low since the majority of the site is surrounded by development and a large portion of suitable habitat is disturbed. Additionally, this species has not been recorded within the vicinity since 1908. No signs of this species were observed during any site surveys conducted in 2015.

Western Mastiff Bat (*Eumops perotis californicus*): This mammal species is a state species of special concern. This species prefers chaparral, cismontane woodlands, coastal scrub, and valley and foothill grassland habitats.

Western mastiff bat was determined to have a potential to occur for foraging only within the study area. However, the potential was considered low since although bats in this family are known to be strong fliers and can fly long distances to forage, habitat on the study area is disturbed and the majority of the study area is surrounded by development. This species preferred roosting habitat is not present on the study area and the nearest CNDDB occurrence record is from1990 approximately 3.0 miles to the southwest of the study area, in an area that is now a residential development. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Pocketed free-tailed bat (*Nyctinomops femorasaccus*): This bat species is a state species of special concern and occurs in more arid habitats, roosting in rock crevices, caverns, or buildings.

Pocketed free-tailed bat was determined to have a potential to occur for roosting only within the study area based on the presence of rock outcrops. However, this potential was considered very low since this species typically prefers steeper cliffs for roosting habitat. Although little is known regarding home range for this species, the potential for roosting is also unlikely since the study area does not support adjacent foraging habitat (CDFW, 2000b). There are only 2 CNDDB occurrence records in the vicinity. The nearest record is from 1985 approximately 6.5 miles to the southwest of the study area near March Air Force Base. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Lesser long-nosed bat (*Leptonycteris verbabuenae*): This bat species is a federally endangered species and occurs in more arid habitats, such as desert grasslands and shrublands.

Pocketed free-tailed bat was determined to have a potential to occur for roosting and foraging. Potential night roosts included a limited number of trees and rock crevices on the northwestern corner of the project and scattered cactus may provide feeding opportunities. Although day roosting habitat (caves or mines) are not present on the study area, this species can travel long distances between day roosting and foraging sites. However, the potential was considered very low for both roosting and foraging since this species not typically found in California and recorded sightings are typically vagrant migrants. There is only 1 CNDDB occurrence record within the vicinity from 1993, approximately 9.5 miles to the northeast in a residential neighborhood of Yucaipa. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Pallid bat (*Leptonycteris verbabuenae*): This bat species is a federally endangered species and occurs in more arid habitats, such as desert grasslands and shrublands.

Pocketed free-tailed bat was determined to have a potential to occur for roosting and foraging. Potential night roosts included a limited number of trees and rock crevices on the northwestern corner of the project and scattered cactus may provide feeding opportunities. Although day roosting habitat (caves or mines) is not present on the study area, this species can travel long distances between day roosting and foraging sites. However, the potential was considered very low for both roosting and foraging since this species not typically found in California and recorded sightings are typically vagrant migrants. There is only one CNDDB occurrence record within the vicinity from 1993, approximately 9.5 miles to the northeast in a residential neighborhood of Yucaipa. No incidental sightings of this species occurred during any site surveys conducted in 2015 and 2016.

Migratory Birds and Raptors

The study area supports some potential nesting and foraging habitat for nesting birds and raptors, primarily in the northwestern corner of the study area where there are shrubs and some trees. Several species of birds were observed on-site (see Appendix A) and were identified by CNDDB as potentially occurring within the 9-quadrangle search area (see Appendix C). Raptors observed on-site include Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), and American kestrel (*Falco sparverius*). There is also a foraging potential for listed raptors within the 9-quadrangle search area according to CNDDB, such as golden eagle (State Fully Protected) and Swainson's hawk (Federally Threatened), though the potential of foraging is considered low and neither are expected to nest on-site (see Appendix C).

4.7.7 Study Area's Relationship to the Western Riverside County MSHCP

This section provides a discussion of the study area's relationship to the MSHCP policies, including the location within the MSHCP Area Plan, Criteria Cells, and cores and linkages, and the presence of MSHCP protected biological resources.

4.7.7.1 Location of the Study Area within the MSHCP Area Plan and Criteria Cells

The entire study area is within the Reche Canyon/Badlands Area Plan (see Figure 6) of the MSHCP but is not within a Criteria Cell, a designated Cell Group, or a subunit within the Southwest Area Plan that requires conservation of land for inclusion in the MSHCP Conservation Area (Riverside County TLMA, 2015).

4.7.7.2 Location of the Study Area within MSHCP Cores and Linkages

As mentioned previously in section 4.5.2, *Wildlife Movement within the Study Area*, the study area is not within any cores or linkages (i.e., Special Linkage Areas) as identified in the Reche Canyon/Badlands Area Plan.

4.7.7.3 Riparian/Riverine Areas and Vernal Pools

Section 6.1.2, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools,* of the MSHCP provides for the protection of Riparian/Riverine Areas and Vernal Pools within the MSHCP Plan Area. Riparian/Riverine areas are defined in the MSHCP as "lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or which depend upon soil moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year." Vernal pools are defined in the MSHCP as "seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season."

As shown in **Figure 12**, *MSHCP Riverine Areas*, and summarized in **Table 3**, *MSHCP Riverine* Areas, The project study areas support a total 0.165 acre of MSHCP Riverine Areas including 0.059 acre in Drainage A (0.046 acre on-site and 0.013 acre off-site), 0.070 acre in Drainage B, 0.001 acre in Drainage B1, 0.001 acre in Drainage B2, 0.001 acre in Drainage B3, 0.002 acre in Drainage B4, and 0.033 acre in Drainage B5. All drainages are considered MSHCP Riverine Areas (rather than MSHCP Riparian Areas) since they are supported by ephemeral[9] flows and do not support riparian vegetation communities. No vernal pools occur within the on- and off-site study areas. Due to the presence of MSHCP Riverine features, the project will require a Determination of Biologically Equivalent or Superior Preservation (DBESP) analysis for any impacts proposed to these areas. The DBESP is required to provide details on any proposed impacts and compensatory mitigation for compliance with MSHCP requirements for submittal to the County of Riverside Environmental Programs Department (EPD), subject to approval by the

[9] Riparian drainages are streambeds that generally convey runoff during, and immediately after, a storm event.

County of Riverside Regional Conservation Authority (RCA) and the State and Federal Wildlife Agencies (CDFW and USFWS).

TABLE 3
MSHCP RIVERINE AREAS

Drainage (Study Area)	Length (ft)	Area (acres)	Riparian/Riverine Flow Classification
A (On-Site)	285	0.046	Riverine
A (Off-Site)	111	0.013	Riverine
B (Off-Site)	306	0.069	Riverine
B1 (Off-Site)	0*	0.001	Riverine
B2 (Off-Site)	32	0.001	Riverine
B3 (Off-Site)	25	0.001	Riverine
B4 (Off-Site)	34	0.001	Riverine
B5 (Off-Site)	35	0.033	Riverine
Total	**828**	**0.165**	

** Less than one linear foot of jurisdiction occurs within Drainage B1 as the majority of the drainage within the off-site study area is associated with an existing corrugated metal pipe that was not quantified.*

Source: ESA PCR, 2014

The biological function and value of the on- and off-site Riverine Areas within Drainage A and Drainage Complex B include the transport of water, which is limited based on the ephemeral flows of the drainage and limited watershed. The function and value of the drainages are also limited since they are primarily unvegetated and support only some small patches of upland and/or ruderal vegetation. Other types of aquatic features that could provide suitable habitat for Riparian/Riverine species, such as fairy shrimp, are not present within the study area (i.e. vernal pools, swales, vernal pool-like ephemeral ponds, seasonal ponds, stock ponds, or other human-modified depressions such as tire ruts, etc.).

MSHCP Riverine Areas

FSA PCR

Riparian/Riverine Plant Species

A habitat assessment was conducted for species listed in Section 6.1.2, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*, of the MSHCP. The results are presented in **Table 4**, *MSHCP Riparian/Riverine Plant Species*. Only one Riparian/Riverine plant species was determined to have a potential to occur on the study area, namely smooth tarplant (*Centromadia pungens* ssp. *laevis*). This species was considered to have a potential to occur only within the riverine habitat associated with the on- and off-site drainages; however, smooth tarplant was not observed during any of the focused plant surveys and therefore was concluded to be absent from the project site. The remaining MSHCP Riparian/Riverine plant species are not expected to occur within the study area due to the lack of suitable habitat or the location of the study area.

TABLE 4
MSHCP RIPARIAN/RIVERINE PLANT SPECIES

Species	Potential to Occur within the Study Area
Brand's phacelia *Phacelia stellaris*	Not expected to occur. This species has not been recorded in the Moreno Valley area. There is only one occurrence record in CNDDB within Riverside County, which was observed in 2000 in the City of Riverside near the Santa Ana River.
California Orcutt grass *Orcuttia californica*	Not expected to occur due to the lack of vernal pools.
Coulter's matilija poppy *Romneya coulteri*	Not expected to occur. This perennial plant has conspicuous flowers that would have been detected during the focused plant surveys if present.
Engelmann oak *Quercus engelmannii*	Not expected to occur. This is a conspicuous tree species that would have been detected during the focused plant surveys if present.
Fish's milkwort *Polygala cornuta* var. *fishiae*	Not expected to occur. The majority of occurrence records of this species on CNDDB are confined to the Santa Ana Mountains.
graceful tarplant *Holocarpha virgata* ssp. *Elongate*	Not expected to occur due to disturbance on-site. The study area is outside of the species' range; there are no known records of this species within the flatter agricultural areas east of the Santa Ana Mountains.
lemon lily *Lilium parryi*	Not expected to occur due to the lack of suitable habitat. Also, the study area is outside the species' range; this species is restricted to the San Jacinto Mountains. The study area is outside of species' elevation range.
Mojave tarplant *Deinandra mohavensis*	Not expected to occur. The study area is outside the species range; this species is restricted to the San Jacinto Mountains. The study area is outside of species' elevation range.
mud nama *Nama stenocarpum*	Not expected to occur due to the lack of wetlands. None were incidentally observed during any surveys (this species can occasionally occur in non-wetlands).
ocellated Humboldt lily *Lilium humboldtii* ssp. *ocellatum*	Not expected to occur due to high disturbance within the drainages and lack of shade. This species is typically found at higher elevations.
Orcutt's brodiaea *Brodiaea orcuttii*	Not expected to occur due to the lack of vernal pools.
Parish's meadowfoam *Limnanthes alba* ssp. *parishii*	Not expected to occur due to the lack of suitable habitat. Also, the study area is outside the species' range; this species is restricted to the Santa Rosa Plateau within the MSHCP Plan Area. The study area is outside of this species' elevation range.

Species	Potential to Occur within the Study Area
prostrate navarretia *Navarretia prostrata*	Not expected to occur due to the lack of suitable habitat. Also, the study area is outside the species' range; this species is restricted to the Santa Rosa Plateau within the MSHCP Plan Area. The study area does not support suitable vernal pool habitat.
San Diego button-celery *Eryngium aristulatum* var. *parishii*	Not expected to occur. The study area is outside the species' range; this species is restricted to the Santa Rosa Plateau within the MSHCP Plan Area. The study area does not support suitable vernal pool habitat.
San Jacinto Valley crownscale *Atriplex coronata* var. *notatior*	Not expected to occur due to the lack of suitable alkaline habitat.
San Miguel savory *Satureja chandleri*	Not expected to occur due to the lack of suitable metavolcanic substrate habitat.
Santa Ana River woollystar *Eriastrum densifolium* ssp. *sanctorum*	Not expected to occur due to lack of suitable habitat. The study area is outside the species range; this species is restricted to the Santa Ana River and alluvial fan sage scrub habitat.
slender-horned spineflower *Dodecahema leptoceras*	Not expected to occur due to the lack of alluvial fan habitat.
smooth tarplant *Centromadia pungens* ssp. *laevis*	Potential, but not observed. This species was not observed during the focused plant surveys.
southern California black walnut *Juglans californica*	Not expected to occur. This is a conspicuous tree species that would have been detected if present.
spreading navarretia *Navarretia fossalis*	Not expected to occur due to the lack of vernal pools.
thread-leaved brodiaea *Brodiaea filifolia*	Not expected to occur due to the lack of vernal pools.
vernal barley *Hordeum intercedens*	Not expected to occur due to the lack of vernal pools.

SOURCE: ESA PCR, 2016

Riparian/Riverine Wildlife Species

Habitat assessments were conducted for wildlife species listed in Section 6.1.2, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*, of the MSHCP. The results are presented in **Table 5**, *MSHCP Riparian/Riverine Wildlife Species*. No riparian/riverine wildlife species are expected to occur on the study area due to the lack of suitable habitat.

TABLE 5
MSHCP RIPARIAN/RIVERINE WILDLIFE SPECIES

Species	Potential to Occur within the Study Area
arroyo toad *Anaxyrus californicus*	Not expected to occur due to the lack of suitable habitat (perennial streams).
mountain yellow-legged frog *Rana muscosa*	Not expected to occur due to the lack of suitable habitat (perennial streams).
California red-legged frog *Rana aurora draytonii*	Not expected to occur due to the lack of suitable habitat (perennial streams).

Species	Potential to Occur within the Study Area
bald eagle *Haliaeetus leucocephalus*	Not expected to occur due to the lack of suitable habitat for foraging and nesting.
least Bell's vireo *Vireo bellii pusillus*	Not expected to occur due to the lack of suitable habitat for foraging and nesting.
American peregrine falcon *Falco peregrinus anatum*	Not expected to occur due to the lack of suitable habitat for foraging and nesting (cliffs overlooking open areas or large bodies of water).
southwestern willow flycatcher *Empidonax traillii extimus*	Not expected to occur due to the lack of suitable habitat for foraging and nesting.
western yellow-billed cuckoo *Coccyzus americanus occidentalis*	Not expected to occur due to the lack of suitable habitat for foraging and nesting; outside of the species range.
Santa Ana sucker *Catostomus santaanae*	Not expected to occur due to the lack of suitable habitat (perennial streams).
Riverside fairy shrimp *Streptocephalus woottoni*	Not expected to occur due to the lack of suitable habitat (vernal pools).
vernal pool fairy shrimp *Branchinecta lynchi*	Not expected to occur due to the lack of suitable habitat (vernal pools).
Santa Rosa Plateau fairy shrimp *Linderiella santarosae*	Not expected to occur due to the lack of suitable habitat (vernal pools).

SOURCE: ESA PCR, 2016

4.7.7.4 Narrow Endemic Plant Species Survey Area

The study area is not within the Narrow Endemic Plant Species Survey Area; therefore, no surveys were required for Narrow Endemic plant species.

4.7.7.5 Additional Survey Needs and Procedures

Section 6.3.2, *Additional Survey Needs and Procedures*, of the MSHCP provides for additional survey needs for the burrowing owl, as well as a number of special-status plant, amphibian, and mammal species.

Burrowing Owl Survey Area

The study area is within the Burrowing Owl Survey Area; therefore, in compliance with the Western Riverside County MSHCP, surveys are required for this species. As discussed above in section 4.7.6 Special-status Wildlife Species, Step I and Step II surveys conducted for the project following Western Riverside County MSHCP protocol were negative. Although the site does not currently support burrowing owls, pre-construction surveys are required within 30 days of ground disturbance based on the presence of suitable habitat.

Criteria Area Species Survey Area

The study area is not within the Criteria Area Species Survey Area; therefore, no surveys were required for Criteria Area plant species.

Amphibian Species Survey Area

The study area is not within the Amphibian Species Survey Area; therefore, no surveys are required.

Mammal Species Survey Area

The study area is not within the Mammal Species Survey Area; therefore, no surveys are required.

4.7.7.6Urban/Wildlands Interface

Section 6.1.4, *Guidelines Pertaining to the Urban/Wildlands Interface*, of the MSHCP presents a number of guidelines that are intended to address indirect effects associated with locating developments in proximity to a Western Riverside County MSHCP Conservation Area. These guidelines address the quantity and quality of any runoff generated by the development (i.e., drainage and toxics), night lighting, noise, non-native invasive plant species, barriers to humans and animal predators, and grading/land development encroachment.

The study area is not within or in the vicinity of any Criteria Cells (see Figure 6) and, as such, development of the site is not expected to result in indirect effects to MSHCP Conservation Areas related to night lighting, noise, and grading/land development, and barriers would not be necessary. Drainage A and Drainage Complex B ultimately drain to the San Jacinto River, which is a Constrained Linkage (19) and where Criteria Cells are located. Runoff from the site therefore has the potential to affect the quantity and quality of water downstream, in addition to the transport of plant seeds. Since the project will be required to comply with flood and water quality standards[10], no indirect effects from the quantity and quality of run-off will occur to downstream areas. At minimum, no invasive, non-native plant species listed in Tables 6-2 of the MSHCP, *Plants That Should Be Avoided Adjacent To The MSHCP Conservation Area*, will be utilized in the landscape plans. This will avoid dispersal of invasive plant seeds in the watershed. Despite the study area not being within any Criteria Cells or adjacent to any MSHCP Conservation Areas, it does support one on-site drainage and one off-site drainage complex that are considered Riverine Areas. The above measures will avoid indirect impacts to these drainages from runoff and invasive species.

10 The project will be required to prepare a Water Quality Management Plan and Storm Water Pollution Prevention Plan consistent with Regional Water Quality Control Board and County requirements that will outline measures such as Best Management Practices (BMPS) to address water quantity and quality, and to address any potential flooding.

5.0 THRESHOLDS OF SIGNIFICANCE

The environmental impacts relative to biological resources are assessed using impact significance threshold criteria which mirror the policy statement contained in the CEQA, Section 21001(c) of the California Public Resources Code. Accordingly, the State Legislature has established it to be the policy of the State to:

> *"Prevent the elimination of fish or wildlife species due to man's activities, ensure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities..."*

Determining whether or not a project may have a significant effect, or impact, plays a critical role in the CEQA process. According to CEQA, Section 15064.7, Thresholds of Significance, each public agency is encouraged to develop and adopt (by ordinance, resolution, rule, or regulation) thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant. In the development of thresholds of significance for impacts to biological resources CEQA provides guidance primarily in Section 15065, Mandatory Findings of Significance, and the State CEQA Guidelines, Appendix G, *Environmental Checklist Form*. Section 15065(a) states that a project may have a significant effect where:

> *"The project has the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or wildlife community, reduce the number or restrict the range of an endangered, rare, or threatened species..."*

Appendix G of the State CEQA Guidelines is more specific in addressing biological resources and encompasses a broader range of resources to be considered, including: candidate or other special-status species; riparian habitat or other special-status natural communities; Federally protected wetlands; fish and wildlife movement corridors; local policies or ordinances protecting biological resources; and, adopted HCPs. This is done in the form of a checklist of questions to be answered during the Initial Study leading to the preparation of the appropriate environmental documentation for a project [i.e., Negative Declaration, Mitigated Negative Declaration, or Environmental Impacts Report (EIR)]. Because these questions are derived from standards in other laws, regulations, and other commonly used thresholds, it is reasonable to use these standards as a basis for defining significance thresholds in an EIR. Therefore, for the purpose of this analysis, impacts to biological resources are considered potentially significant (before considering offsetting mitigation measures) if one or more of the following conditions would result from implementation of the proposed Project.

Threshold BIO-A Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Wildlife Service.

Note: Threshold BIO-A also encompasses the threshold on the Riverside County Environmental Assessment/Initial Study form as follows: "Have a substantial adverse effect, either directly or through habitat modifications, on any endangered, or threatened species, as listed in Title 14 of the California Code of Regulations (Sections 670.2 or 670.5) or in Title 50, Code of Federal Regulations (Sections 17.11 or 17.12)."

Threshold BIO-B Have a substantial adverse effect on any riparian habitat or other sensitive plant community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U. S. Fish and Wildlife Service.

Threshold BIO-C Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

Threshold BIO-D Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery areas.

Threshold BIO-E Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Threshold BIO-F Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

For the purposes of this impact analysis the following definitions apply:

- "Substantial adverse effect" means loss or harm of a magnitude which, based on current scientific data and knowledge would: (1) substantially reduce population numbers of a listed, candidate, sensitive, rare, or otherwise special status species; (2) substantially reduce the distribution of a sensitive plant community/habitat type; or (3) eliminate or substantially impair the functions and values of a biological resource (e.g., streams, wetlands, or woodlands) in a geographical area defined by interrelated biological components and systems. In the case of this analysis, the prescribed geographical area is considered to be the region that includes the USGS topographic quadrangle for the study area, namely Sunnymead. For some species, the geographic area may extend to the vicinity of the study area based on known distributions of the species. The vicinity of the study area is considered to comprise the following USGS topographic quadrangles: San Bernardino South, Redlands, Yucaipa, Riverside East, El Casco, Steele Peak, Perris, and Lakeview.

- "Conflict" means contradiction of a magnitude, which based on foreseeable circumstances, would preclude or prevent substantial compliance.

- "Rare" means: (1) that the species exists in such small numbers throughout all, or a significant portion of, its range that it may become endangered if its environment worsens; or (2) the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered "threatened" as that term is used in the FESA.

This page intentionally blank.

6.0 PROJECT RELATED IMPACTS

6.1 Regulatory Setting

Special-status species are provided protection by either Federal or State resource management agencies, or both, under provisions of the FESA and CESA.

There are a number of performance criteria and standard conditions that must be met as part of any review and approval of the proposed project. These include compliance with all of the terms, provisions, and requirements with applicable laws that relate to Federal, State, and local regulating agencies related to potential impacts to special-status plant and wildlife species, wetlands, riparian habitats, and blue lined stream courses. The following summarizes federal and state regulations, and CNPS, as previously discussed in section 4.7, *Special-Status Biological Resources*.

6.1.1 Federal Regulations

As previously discussed in section 4.7.1, Federal Sensitive Resource Protection and Classifications of this BRA, under provisions of Section 9(a)(1)(B) of the FESA, unless properly permitted, it is unlawful to "take" any listed species. In a case where a property owner seeks permission from a Federal agency for an action which could affect a Federally-listed plant and animal species, the property owner and agency are required to consult with USFWS to obtain appropriate permits. Section 9(a)(2)(b) of the FESA addresses the protections afforded to listed plants. In addition to FESA, take of migratory birds, or bald or golden eagles, require permits pursuant to the MBTA and the Bald and Golden Eagle Protection Act, respectively. Furthermore, any impacts to USACE and RWQCB jurisdictional waters would require permitting pursuant to Sections 404 and 401 of the CWA, respectively.

6.1.2 State of California Regulations

As previously discussed in section 4.7.2, *State of California Sensitive Resource Protection and Classifications* of this BRA, Article 3, Sections 2080 through 2085, of the CESA addresses the taking of threatened or endangered species. Exceptions authorized by the State to allow "take" require permits or memoranda of understanding and can be authorized for "endangered species, threatened species, or candidate species for scientific, educational, or management purposes." Sections 1901 and 1913 of the California Fish and Wildlife Code provide that notification is required by an initiator prior to disturbance. State regulations also exist for protection of birds pursuant to the MBTA, and for acquiring permits for impacts to CDFW jurisdictional streambeds pursuant to Section 1602 of the Fish and Game Code.

6.1.3 California Native Plant Society

As previously discussed in section 4.7.2, *State of California Sensitive Resource Protection and Classifications* of this BRA, the CNPS has compiled an inventory comprised of the information focusing on geographic distribution and qualitative characterization of rare, threatened, or endangered vascular plant species of California which classifies plant species into categories of rarity. Informally ranked species are not protected per se, but warrant consideration in the preparation of biological assessments.

6.1.4 Local Regulations

The study area is within the adopted Western Riverside County MSHCP Plan area. The Western Riverside County MSHCP provides permits for the take of all species identified in the MSHCP as covered and conditionally covered, so long as the conditions imposed are satisfied (see also sections 4.7.3 and 4.7.7 above).

6.2 Project Related Impacts

The analysis in section *6.3 Impact Analysis* of this BRA examines the potential impacts to plant and wildlife resources that may occur as a result of implementation of the project. For the purpose of this assessment, project-related impacts take two forms, direct and indirect. Direct impacts are considered to be those that involve the loss, modification or disturbance of natural habitats (i.e., vegetation or plant communities), which in turn, directly affect plant and wildlife species dependent on that habitat. Direct impacts also include the destruction of individual plants or wildlife, which is typically the case in species of low mobility (i.e., plants, amphibians, reptiles, and small mammals). The collective loss of individuals in these manners may also directly affect regional population numbers of a species or result in the physical isolation of populations thereby reducing genetic diversity and, hence, population stability.

Indirect impacts are considered to be those that involve the effects of increases in ambient levels of sensory stimuli (e.g., noise, light), unnatural predators (e.g., domestic cats and other non-native animals), and competitors (e.g., exotic plants, non-native animals). Indirect impacts may be associated with the construction and/or eventual habitation/operation of a project; therefore, these impacts may be both short-term and long-term in their duration. These impacts are commonly referred to as “edge effects” and may result in changes in the behavioral patterns of wildlife and reduced wildlife diversity and abundance in habitats adjacent to study area.

The determination of impacts in this analysis is based on both the proposed project development plan and the biological values of the habitat and/or sensitivity of plant and wildlife species to be affected. Any recommended mitigation measures to address impacts are discussed in section 7.0 below, and compliance with existing regulations are also outlined in section 7.0 as Conditions of Approval.

The biological values of resources within, adjacent to, and outside the area to be affected by the proposed project were determined by consideration of several factors, as applicable. These included the overall size of habitats to be affected, the study area’s previous land uses and disturbance history, the study area's surrounding environment and regional context, the on-site biological diversity and abundance, the presence of special-status plant and wildlife species, the study area's importance to regional populations of these species, and the degree to which on-site habitats are limited or restricted in distribution on a regional basis and, therefore, are considered sensitive in themselves. Therefore, the focus of this impacts analysis is on sensitive plant communities/habitats, resources that play an important role in the regional biological systems, and special-status species.

Impacts to biological resources as a result of project development were analyzed in GIS using Computer-Aided Design (CAD) data of the project footprint and guidelines on temporary impact areas for the drainage crossings, both provided by the project engineer. Acreages of impacts were calculated by overlaying the CAD data and adding the fuel modification zones over GPS data of biological resources collected by ESA PCR during the surveys.

6.3 Impact Analysis

6.3.1 Impacts to Special-Status Species

Threshold BIO-A: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Wildlife Service?

Less than Significant with Mitigation Incorporated

6.3.1.1 Special-Status Plant Species

Development of the study area would result in the direct removal of numerous common plant species; a list of plant species observed within the study area is included in Appendix A. Common plant species present within the study area occur in large numbers throughout the region and their removal does not meet the significance thresholds defined in Section 5.0, *Thresholds of Significance* above. Therefore, impacts to common plant species would not be considered a significant impact and no mitigation measures are required.

A total of 53 special-status plant species of the 65 species identified as occurring in the project vicinity in available databases (see section 4.7.5 above) are not expected to occur within the study area due to the lack of suitable habitat or because the site is outside the known distribution or elevation range for the species. These species are listed in Appendix B. As discussed in section 4.7.5, above, the remaining 12 special-status plant species were determined to have a potential to occur on the study area; however, these 12 species are not expected to occur within the project site or off-site water and sewer line areas since focused surveys conducted within these areas were negative. As such, no impacts to special-status plant species would occur as a result development on the project site and within the proposed off-site water and sewer lines and no mitigation is required.

Although a summer focused survey was performed within the off-site manufactured slope area to the east of the project site, a spring focused survey has not been conducted within this off-site area. Of the 12 species with a potential to occur, seven (7) species are not expected to occur within the off-site manufactured slope area since these species were not detected during the summer focused survey or the area does not support suitable habitat, including California screw most (*Tortula californica*), smooth tarplant, San Bernardino aster (*Symphyotrichum defoliatum*), chaparral sand-verbena (*Abronia villosa* var. *aurita*), long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*), salt spring checkerbloom (*Sidalcea neomexicana*), and mesa horkelia (*Horkelia cuneate* var. *puberula*). The blooming period of the remaining five (5) species with the potential to occur within the off-site manufactured slope area east of the project boundary fall outside of the summer survey window, which include Nevin's barberry (*Berberis nevinii*), Jaeger's bush milk-vetch (*Astragalus pachypus* var. *jaegeri*), round-leaved filaree (*California macrophylla*), Parry's spineflower (*Chorizanthe parryi* var. *parryi*), and white-bracted spineflower (*Chorizanthe xanti* var. *leucotheca*). Of these five species, Nevin's barberry, Jaeger's bush milk-vetch, and round-leaved filaree are covered by the MSHCP. Parry's spineflower and white-bracted spineflower are not currently covered by the MSHCP and impacts to these individuals, if present, would be significant. As such, a mitigation measure is prescribed as MM BIO-1 in section 7.2.1, which requires a spring focused plant survey to be conducted within the off-site manufactured slope area located directly east of the site prior to ground disturbance in the appropriate blooming period (between April and June) to determine the presence/absence of Parry's spineflower and white-bracted spineflower. If either or both of these species are found within the off-site eastern manufactured slope area, MM BIO-1 outlines the necessary actions that are required to reduce impacts to the special-status plant species to less than significant.

6.3.1.2 Special-status Wildlife Species

Development of the study area would result in the disruption and removal of habitat and the loss and displacement of common wildlife species. A list of wildlife species observed within the study area is included in Appendix A. Due to the limited amount of native habitat to be removed and the level of existing disturbance from human activity within the vicinity (e.g., nearby development), these impacts would not be expected to reduce the general wildlife populations below self-sustaining levels within the region and impacts to common wildlife species do not meet the significance thresholds defined in Section 5.0, *Thresholds of Significance* above. Therefore, impacts to common wildlife species would not be considered a significant impact and no mitigation measures are required.

A total of 25 special-status wildlife species of the 43 species identified as occurring in the project vicinity in available databases (see section 4.7.6 above) are not considered to have a potential to occur within the study area due to the lack of suitable habitat or because the site is outside the known distribution range for the species. These species are listed in Appendix C. Since these species are not expected to be present on the study area, no impacts would occur as a result of project development and no mitigation measures are required.

As discussed in section 4.7.6, above, the remaining 19 special-status wildlife species were determined to have a potential to occur on the study area. Of these species, focused surveys were conducted for burrowing owl, which is conditionally covered by the MSHCP with additional surveys and mitigation required as discussed in further detail below. Of the remaining 17 potential special-status wildlife species, 12 species are covered by the MSHCP with no survey or conservation requirements for the study area, including coast horned lizard, orange-throated whiptail, red diamondback rattlesnake, golden eagle, Swainson's hawk, loggerhead shrike, coastal California gnatcatcher, northwestern San Diego pocket mouse, Stephens' kangaroo rat (covered by the SKR HCP), Los Angeles pocket mouse, San Diego black-tailed jackrabbit, and San Diego desert woodrat. Therefore, assuming payment of the applicable fees (the MSHCP Local Development Mitigation Fee and the SKR HCP fee for the Stephens' kangaroo rat) and compliance with required guidelines in the MSHCP (see section 7.2.5 below), no additional mitigation is required for these species.

The remaining six (6) species, the southern grasshopper mouse, American badger, western mastiff bat, pocketed free-tailed bat, lesser long-nosed bat, and pallid bat are not covered by the MSHCP. These species are listed as species of special concern by the CDFW and do not carry a federal or state listing as threatened or endangered. These species are considered to have a low to very low potential to occur on the study area based on the limited habitat and/or quality of the habitat, and no significant impacts are anticipated to these species as described below. The study area also has the potential to support migratory birds and raptors that are discussed further in 6.2.4.2 of this report.

- No significant impact to southern grasshopper mouse since this species is only considered to have a low potential to occur as it has not been recorded on CNDDB within the vicinity of the study area since 1938.

- No significant impact to American badger since this species was considered to have low potential to occur. The majority of the site is surrounded by development and a large portion of suitable habitat is disturbed. Additionally, this species has not been recorded on CNDDB within the vicinity of the study area since 1908.

- No significant impact to western mastiff bat since this species was only considered to have a low potential to occur for foraging with no suitable roosting habitat on the study area. Although bats in this family are known to be strong fliers and can fly long distances to forage, there is only a low probability that these species will travel to the study area based on the disturbance present on the study area and presence of surrounding development. The nearest CNDDB occurrence record of this species was recorded in 1990 approximately 3.0 miles to the southwest of the study area.

- No significant impact to pocketed free-tailed bat since this species was only considered to have a very low potential to occur for roost with no suitable roosting habitat on the study area. The potential for roosting was considered very low since this species typically prefers steeper cliffs for roosting habitat. Although little is known regarding home range for this species, the potential for roosting is also unlikely since the study area does not support adjacent foraging habitat.[11] There are only two CNDDB occurrence records in the vicinity.

11 CDFW. 2000. California Wildlife Habitat Relationships System: Pocketed Free-tailed Bat. State of California, The Resources Agency. May 2000.

The nearest record is from 1985 approximately 6.5 miles to the southwest of the study area near March Air Force Base.

- No significant impact to lesser long-nosed bat since this species was only considered to have a very low potential to roost and forage on the study area. The potential was considered low since this species is not typically found in California. Records in California are typically vagrant migrants. This species has only been recorded once on CNDDB within the vicinity of the study area, which was in 1993 approximately 9.5 miles to the northeast in a residential neighborhood of Yucaipa.

- No significant impact to pallid bat since this species was only considered to have a very low potential to roost and forage on the study area. The potential was considered very low because of evidence of disturbance on the study area and the presence of surrounding development to the south, northeast, and west; this species is highly sensitive to disturbance. Additionally, this species has not been recorded on CNDDB within the vicinity since 1929.

The above six species were not considered for coverage under the MSHCP, indicating that regionally significant populations of these species do not exist within the MSHCP boundaries. Based on the above discussion, the study area is not capable of supporting large populations of these species and a loss of a few individuals, if present, would not expect to reduce regional population numbers. Therefore, any impacts to these species would be less than significant and no mitigation measures are considered required.

Burrowing Owl

The study area supports potentially suitable burrowing owl (Species of Special Concern) habitat, but no active burrowing owl burrows, signs, or individuals were found on-site during the Step I and Step II surveys.

Although the study area does not currently support burrowing owls, a pre-construction survey is required in compliance with the MSHCP. Specifically, in accordance with the County of Riverside's *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area* (County of Riverside, 2006), a pre-construction survey for burrowing owl within the study area is required within 30 days prior to ground disturbance to avoid potential direct take of burrowing owls in the future. A Condition of Approval (COA BIO-1) requiring this survey is provided in section 7.2.2 below, in addition to a recommended mitigation measure (MM BIO-2) should burrowing owls be present in the future. Mitigation is proposed consistent with the burrowing owl mitigation guidelines published by CDFW (CDFW, 2012).

6.3.2 Impacts to Sensitive Plant Communities

Threshold BIO-B: Would the project have a substantial adverse effect on any riparian habitat or other sensitive plant community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U. S. Fish and Wildlife Service?

No Impacts (Sensitive Plant Communities)

Less than Significant with Regulatory Compliance (CDFW Jurisdiction)

6.3.2.1 Sensitive Plant Communities

Sensitive plant communities were not observed within the study area; therefore, no impacts would occur. There are seven native communities on the study area that total 9.48 acres, including brittlebush scrub, brittlebush scrub/ruderal, buckwheat scrub/ruderal, laurel sumac scrub/ruderal, Riversidean sage scrub, Riversidean sage scrub/ruderal, and rock outcrop/Riversidean sage scrub. Permanent impacts to native communities on the study area are proposed to 2.91 acres, which is only 3.8 percent of the total proposed permanent impacts (75.81 acres) to plant communities. The majority of permanent impacts are proposed to ruderal (37.66 acres) and disturbed (30.54 acres) areas, which are dominated by non-native species. Impacts to these areas comprise 90.0 percent of the total impacts to plant communities on the study area. In addition to permanent impacts, 0.83 acres of fuel modification and 1.25 acres of temporary impacts are proposed to native communities on the study area. Impacts to plant communities are shown in **Figure 13**, *Impacts to Plant Communities* and **Table 6**, *Existing and Proposed Impacts to Plant Communities*.

TABLE 6
EXISTING AND PROPOSED IMPACTS TO PLANT COMMUNITIES

Plant Communities	Existing (acres)	Permanent Impacts (acres)	Fuel Modification Impacts (acres)	Temporary Impacts (acres)
Brittlebush Scrub	2.61	0.92	0.32	0.69
Brittlebush Scrub/Ruderal	0.52	0.51	0.00	0.01
Buckwheat Scrub/Ruderal	0.13	0.13	0.00	0.00
Laurel Sumac Scrub/Ruderal	0.78	0.36	0.26	0.16
Riversidean Sage Scrub	3.22	0.98	0.19	0.33

6.3.2.2 CDFW Jurisdiction

The project study areas support drainages that are considered CDFW jurisdictional streambeds pursuant to Section 1602 of the California Fish and Game Code and are proposed for impacts. Drainage A and Drainage Complex B are all jurisdictional, of which permanent impacts are proposed to Drainages A, B, B2, B3, B4, and B5 totaling 0.077 acre of permanent impacts (including 0.046 acre on-site and 0.031 acre off-site), as shown on **Figure 14**, *Impacts to Jurisdictional Features and MSHCP Riverine Areas*. Existing and impact acreages are summarized in **Table 7**, *Permanent Impacts to CDFW Jurisdictional Features and MSHCP Riverine Areas*. The permanent impacts total approximately 47 percent of the total 0.165 acre of CDFW jurisdiction identified within the on-site and off-site study areas. It should be noted that this report presumes combined impacts associated with the proposed water line alignment and two alternative alignments will occur. However, only one water line alignment will ultimately by implemented. Therefore, permanent and temporary impacts to CDFW jurisdictional waters will be slightly reduced once the final water line alignment is determined. Compensatory mitigation for permanent impacts to CDFW jurisdictional waters will be required for the project based only on impacts associated with the final water line alignment as part of subsequent CDFW Section 1602 permitting requirements. Temporarily impacted CDFW jurisdictional areas will be restored to pre-project conditions following completion of construction.

TABLE 7
IMPACTS TO CDFW JURISDICTIONAL FEATURES AND MSHCP RIVERINE AREAS[a]

Drainage (Study Area)	Existing (acres)	Permanent Impacts (acres)	Temporary Impacts (acres)
Drainage A (On-Site)	0.046	0.046	-
Drainage A (Off-Site)	0.013	0.013	-
Drainage B (Off-Site)	0.069	0.011	0.058
Drainage B1 (Off-Site)	0.001	0.000	0.001
Drainage B2 (Off-Site)	0.001	0.000[b]	0.001
Drainage B3 (Off-Site)	0.001	0.000[c]	0.001
Drainage B4 (Off-Site)	0.001	0.000[d]	0.001
Drainage B5 (Off-Site)	0.033	0.007	0.026
Total	**0.165**	**0.077**	**0.088**

NOTES:
[a] MSHCP Riverine Areas are presumed equivalent to CDFW jurisdiction.
[b] Impacts are considered negligible; actual acreage of impacts to four decimal places is 0.0003 acre.
[c] Impacts are considered negligible; actual acreage of impacts to four decimal places is 0.0001 acre.
[d] Impacts are considered negligible; actual acreage of impacts to four decimal places is 0.0004 acre.

Ironwood Village Project

Figure 14

Impacts to Jurisdictional Features and MSHCP Riverine Areas

ESA PCR

Impacts to CDFW jurisdictional features would be required to comply with Section 1602 of the California Fish and Game Code, including applying for a permit and providing compensatory streambed mitigation as stated above. A Condition of Approval (COA BIO-2) is proposed in section *7.2.3 Measures to Mitigate Potentially Significant Impacts to Jurisdictional Features* of this BRA to comply with the compensatory mitigation requirement of this regulation, subject to approval by CDFW. Compliance with Section 1602 of the California Fish and Game Code would reduce impacts to a less than significant level.

6.3.3 Impacts to Wetlands

Threshold BIO-C: Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less than Significant with Regulatory Compliance

The project study areas do not support wetlands as defined by Section 404 of the Clean Water Act. However, the project study areas do support USACE/RWQCB ephemeral non-wetland jurisdictional streambeds regulated under Sections 404/401 of the Clean Water Act (CWA) that are proposed for impacts. Drainage A and Drainage B5 are considered jurisdictional "waters of the U.S.", of which permanent impacts are proposed totaling 0.034 acre(0.023 acre on-site and 0.011 acre off-site), as shown on Figure 14. Existing and permanent impact acreages are summarized in **Table 8**, *Permanent Impacts to USACE/RWQCB Jurisdictional Features*. The permanent impacts total less than 60 percent of the total 0.058 acre of USACE/RWQCB jurisdiction on-site and off-site. Temporarily impacted areas will be restored to pre-project conditions.

TABLE 8
IMPACTS TO USACE/RWQCB JURISDICTIONAL FEATURES

Drainage	Existing (acres)		Permanent Impacts (acres)		Temporary Impacts (acres)	
	Length (ft)	Area (acres)	Length (ft)	Area (acres)	Length (ft)	Area (acres)
Drainage A	285	0.023	285	0.023	0	0.000
Drainage A (off-site)	111	0.007	111	0.007	0	0.000
Drainage B (off-site)	306	0.026	40	0.004	266	0.022
Drainage B5 (off-site)	35	0.002	10	0.001	25	0.001
Total	**737**	**0.058**	**436**	**0.034**	**366**	**0.023**

SOURCE: ESA PCR, 2016

Impacts to USACE and RWQCB jurisdictional "waters of the U.S." would be required to comply with Sections 404 and 401 of the CWA, respectively, including applying for a permit and mitigation subject to approval by USACE and/or RWQCB. A Condition of Approval (COA

BIO-2) is proposed in section *7.2.3 Measures to Mitigate Potentially Significant Impacts to Jurisdictional Features* of this BRA to comply with the compensatory mitigation requirement of these regulations, subject to approval by USACE and RWQCB. Compliance with Sections 404 and 401 of the CWA is intended to reduce impacts to a less than significant level.

6.3.4 Impacts to Wildlife Movement and Migratory Species

Threshold BIO-D: Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery areas?

Less Than Significant (Wildlife Movement)

Less than Significant with Mitigation Incorporated (Migratory Species)

6.3.4.1 Wildlife Movement

As described in section 4.5.2 above, the study area supports potential live-in and movement habitat for species on a local scale (i.e., some limited live-in and at least marginal movement habitat for reptile, bird, and mammal species), but it likely provides little to no function to facilitate wildlife movement for wildlife species on a regional scale, and is not identified as a regionally important dispersal or seasonal migration corridor. Movement on a local scale likely occurs with species adapted to urban environments due to the development and disturbances in the vicinity of the study area. Although implementation of the project would result in disturbances to local wildlife movement within the study area, those species adapted to urban areas would be expected to persist on-site following construction, particularly within the open space areas. As such, impacts would be less than significant and no mitigation measures would be required. Since the study area does not function as a regional wildlife corridor and are not known to support wildlife nursery area(s), no impacts would occur and no mitigation measures would be required.

6.3.4.2 Migratory Species

Migratory Birds and Raptors

As previously discussed in section 4.7.6, *Special-status Wildlife Species*, the site supports potential nesting and foraging habitat for migratory birds, in addition to potential foraging habitat for raptors. Based on the disturbed nature of the site from agriculture and ongoing maintenance activities, the quality of foraging habitat is considered to be low. Higher quality foraging habitat is considered to occur in less developed areas with larger expanses of open space. The loss of a relatively small acreage of low quality foraging habitat as a result of the project would not be expected to impact the foraging of these species. Therefore, impacts to foraging habitat would be considered less than significant and no mitigation measures are considered required.

The study area has the potential to support songbird and raptor nests due to the presence of shrubs, ground cover, and limited trees on-site. Nesting activity typically occurs from February 15 to August 31. Disturbing or destroying active nests is a violation of the MBTA (16 U.S.C.

703 et seq.). In addition, nests and eggs are protected under Fish and Wildlife Code Section 3503. As such direct impacts to breeding birds (e.g. through nest removal) or indirect impacts (e.g. by noise causing abandonment of the nest) is considered a potentially significant impact as defined by the thresholds of significance (Threshold BIO-D) in Section 6.0 above. Compliance with the MBTA would reduce impacts to a less than significant level, as detailed in MM BIO-3 (see section 7.2.4).

6.2.5 Consistency with Local Policies and Ordinances

Threshold BIO-E: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

No Impacts

The project does not conflict with any local policies or ordinances protecting biological resources, such as tree preservations or ordinances.

6.2.6 Consistency with Adopted Natural Community Conservation Plan

Threshold BIO-F: Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Less than Significant with Mitigation Incorporated

The study area is within the Western Riverside County MSHCP and requires payment of the Local Development Mitigation Fee, compliance with requirements of the MSHCP including the Burrowing Owl Survey Area guidelines (Section 6.3.2 of the MSHCP), and the Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools (Section 6.1.2 of the MSHCP). The study area is not within a cell, a designated cell group, or a subunit within the Reche Canyon/Badlands Area Plan; therefore, conservation of land on the study area is not required pursuant to the MSHCP. The study area is also not within the survey overlays for Criteria Area Species, Narrow Endemic Plant Species, Amphibian Species, or Mammal Species (Section 6.3.2 of the MSHCP). Since the study area is not within or in the vicinity of any Criteria Cells, the project will not result in edge effects that will adversely and directly affect biological resources within the MSHCP Conservation Area. As such, the project will not be subject to certain requirements outlined in the Guidelines Pertaining to the Urban/Wildlands Interface (Section 6.1.3 of the MSHCP) including those for the treatment and management of edge factors including night lighting, noise, barriers for public access and predators, and grading/land development limits. However, runoff from the site has the potential to indirectly affect MSHCP Conservation Areas downstream through the quantity and quality of water discharged from the site, in addition to the transport of plant seeds. Therefore compliance with the drainage, toxics, and invasive requirements outlined in Section 6.1.3 of the MSHCP would be required. A Condition of Approval (COA BIO-3) is proposed in section *7.2.5 Measures to Mitigate Potentially Significant Impacts to the MSHCP* of this BRA, which requires the project to comply with all provisions of the MSHCP prior to issuance of a grading permit. Compliance with COA BIO-3 would reduce impacts to a less than significant level.

Project compliance with the MSHCP pertaining to Burrowing Owl, Riparian/Riverine, and Urban/Wildlands Interface requirements for drainage, toxics and invasives are summarized below:

- The study area is within the Burrowing Owl Survey Area of the MSHCP. Focused burrowing owl surveys were conducted within all portions of the study area that support potentially suitable habitat for this species. No burrowing owls were observed on the study area. However, due to the presence of potentially suitable habitat, a 30-day pre-construction survey for burrowing owl is required pursuant to the MSHCP. If burrowing owls are found within the study area during the 30-day pre-construction survey, impacts to this species would be potentially significant. The Condition of Approval (COA BIO-1) and mitigation measure (MM BIO-2) prescribed in section 7.2.1 below would reduce this impact to a less than significant level and ensure consistency with the MSHCP.

- Drainage A and Drainage Complex B on the study area meet the definition of Riverine Areas pursuant to the MSHCP. The project will result in permanent impacts to 0.078 acre of Riverine Areas, including 0.046 acre within the on-site portion of Drainage A, 0.013 acre in the off-site portion of Drainage A, and 0.018 acre within Drainage Complex B. The permanent impacts are equivalent to approximately 47 percent of the total 0.165 acre of Riverine Areas within the project study areas. The proposed Riverine Areas impacts are summarized in Table 7.

- The biological function and value of the on- and off-site Riverine Areas within Drainage A and Drainage Complex B include the transport of water, which is restricted based on the ephemeral flows of the drainage and limited watershed. The function and value of the drainages are also limited since they support only small patches of upland and/or ruderal vegetation and are primarily unvegetated. Other types of aquatic features that could provide suitable habitat for Riparian/Riverine species, such as fairy shrimp, are not present within the study area (i.e. vernal pools, swales, vernal pool-like ephemeral ponds, seasonal ponds, stock ponds, or other human-modified depressions such as tire ruts, etc.).

- Impacts to Riverine Areas would be potentially significant based on requirements of the MSHCP. According to section 6.1.2 of the MSHCP, if an avoidance alternative is not feasible a Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be made by the Project applicant to ensure the replacement of any lost functions and values of habitat as it relates to MSHCP Covered Species. The condition of approval prescribed in section 7.2.3 below pertaining to jurisdictional drainages ensures consistency with the MSHCP. The DBESP would be submitted to the City and reviewed and approved by the City and the Wildlife Agencies.

- The project has the potential to affect the quantity and quality of water in downstream MSHCP Conservation Areas or Riverine areas via Drainage A and Drainage Complex B through runoff generated by the development and transport of invasive, non-native plants species from project landscaping. Since the project will be required to comply with flood and water quality standards,[12] no indirect effects from the quantity and quality of run-off will occur to downstream areas. In addition, no invasive, non-native plant species listed in Tables 6-2 of the MSHCP, *Plants That Should Be Avoided Adjacent To The MSHCP Conservation Area*, will be utilized in the landscape plans. These measures will avoid impacts to water quality and the dispersal of invasive plant seeds in the watershed and are outlined in the Condition of Approval recommended in section 7.2.5 below.

[12] The project will be required to prepare a Water Quality Management Plan and Storm Water Pollution Prevention Plan consistent with Regional Water Quality Control Board and County requirements that will outline measures such as Best Management Practices (BMPS) to address water quantity and quality, and to address any potential flooding.

This page intentionally blank.

7.0 MITIGATION MEASURES AND CONDITIONS OF APPROVAL

7.1 Approach

Mitigation measures are recommended for those impacts determined to be significant to special-status biological resources (identified in italics in section 7.2 below). Mitigation measures for impacts considered to be "significant" were developed in an effort to reduce such impacts to a level of "insignificance," while at the same time allowing an opportunity to realize development goals under the proposed project. As stated in CEQA Guidelines Section 15370 mitigation includes:

1. Avoiding the impact altogether by not taking a certain action or parts of an action.
2. Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
3. Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.
4. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
5. Compensating for the impact by replacing or providing substitute resources or environments.

Where compliance with existing regulations and the issuance of permits by regulatory agencies would reduce impacts to a less than significant level, those measures are proposed as conditions of approval (identified in non-italics in section 7.2 below).

7.2 Mitigation Measures and Conditions of Approval for Significant Impacts

The following recommended mitigation measures (MM) and conditions of approval (COA) are intended to address potentially significant impacts from the proposed development Project.

7.2.1 Measures to Mitigate Potentially Significant Impacts to Special-Status Plant Species

MM BIO-1 Due to the presence of suitable habitat within the proposed off-site manufactured slope area located directly east of the project boundary, a spring focused plant survey to determine the presence/absence of Parry's spineflower and white-bracted spineflower is required to be conducted during the appropriate blooming periods of the two species (between April and June) prior to ground disturbance. If individuals are found, significant impacts would occur as a result of implementation of the project unless mitigation is implemented to reduce impacts to less than significant. Mitigation includes seed collection of individuals that would be significantly impacted by the project at the end of the growing season and prior to ground disturbance. Collected seeds will be planted within an appropriate on-site or off-site mitigation area, which will be conserved as open space in perpetuity. Mitigation for significant impacts to Parry's spineflower and white-bracted spineflower will be implemented in consultation with the City of Moreno Valley and CDFW.

7.2.2 Measures to Mitigate Potentially Significant Impacts to Special-Status Wildlife Species

COA BIO-1 Due to the presence of suitable habitat and in compliance with the MSHCP, a pre-construction survey for burrowing owl is required within 30 days prior to ground disturbance to determine the presence of burrowing owls and avoid potential direct take of burrowing owls if present.

MM BIO-2 If burrowing owls are determined present during the 30-day pre-construction survey, occupied burrows shall be avoided to the greatest extent feasible, following the guidelines in the Staff Report on Burrowing Owl Mitigation published by Department of Fish and Wildlife (CDFW, 2012) including, but not limited to, conducting pre-construction surveys, avoiding occupied burrows during the nesting and non-breeding seasons, implementing a worker awareness program, biological monitoring, establishing avoidance buffers, and flagging burrows for avoidance with visible markers. If occupied burrows cannot be avoided, acceptable methods may be used to exclude burrowing owl either temporarily or permanently, pursuant to a Burrowing Owl Exclusion Plan that shall be prepared and approved by the County of Riverside Environmental Programs Department (EPD), in coordination with the CDFW. The Burrowing Owl Exclusion Plan shall be prepared in accordance with the guidelines in the Staff Report on Burrowing Owl Mitigation and the MSHCP.

In accordance with the MSHCP, take of active nests will be avoided. Passive relocation (i.e., the scoping of the burrows by a burrowing owl biologist and collapsing burrows free of young) will occur when owls are present outside the nesting season. The EPD may require translocation sites for the burrowing owl to be created in the MSHCP reserve for the establishment of new colonies pursuant to MSHCP objectives for the species. Translocation sites, if required, will be identified in consultation with EPD and/or CDFW taking into consideration unoccupied habitat areas, presence of burrowing mammals, existing colonies, and effects to other MSHCP Covered Species.

7.2.3 Measures to Mitigate Potentially Significant Impacts to Jurisdictional Features

COA BIO-2 Prior to the issuance of any grading permit for permanent impacts in the areas designated as jurisdictional features, the project applicant shall obtain regulatory permits from the USACE, RWQCB, and CDFW. The following shall be incorporated into the permitting, subject to approval by the regulatory agencies:

1. On-site or off-site creation, restoration and/or enhancement of USACE/RWQCB jurisdictional "waters of the U.S." within the San Jacinto watershed at a ratio no less

than 1:1 or within an adjacent watershed at a ratio no less than 2:1 for permanent impacts, and for any temporary impacts to restore the impact area to pre-project conditions (i.e. pre-project contours). Off-site mitigation may occur on land acquired for the purpose of in-perpetuity preservation as approved by the resource agencies, or through the purchase of mitigation credits at a resource agency-approved off-site mitigation bank or in-lieu fee program.

2. On-site or off-site creation, restoration, and/or enhancement of CDFW jurisdictional streambed within the San Jacinto watershed at a ratio no less than 1:1 or within an adjacent watershed at a ratio no less than 2:1 for permanent impacts, and for any temporary impacts to restore the impact area to pre-project conditions (i.e. pre-project contours). Off-site mitigation may occur on land acquired for the purpose of in-perpetuity preservation as approved by the resource agencies, or through the purchase of mitigation credits at a resource agency-approved off-site mitigation bank or in-lieu fee program.

Purchase of any mitigation credits through an agency-approved mitigation bank or in-lieu fee program should occur prior to any impacts to jurisdictional drainages. Any mitigation proposed on land acquired for the purpose of in-perpetuity mitigation that is not part of an agency-approved mitigation bank or in-lieu fee program shall include the creation, restoration, and/or enhancement of similar streambed habitat pursuant to a resource agency-approved Habitat Mitigation and Monitoring Plan (HMMP). The HMMP shall be prepared prior to any impacts to jurisdictional features, and shall provide details as to the implementation of the mitigation, maintenance, and future monitoring of mitigation areas. The goal of the mitigation shall be to create, restore, and/or enhance similar habitat with equal or greater function and value than the impacted habitat.

7.2.4 Measures to Mitigate Potentially Significant Impacts to Migratory or Nesting Birds

MM BIO-3 Prior to the issuance of any grading permit that would remove potentially suitable nesting habitat for raptors or songbirds, the project applicant shall demonstrate to the satisfaction of the City of Moreno Valley that either of the following have been or will be accomplished:

1. Vegetation removal activities shall be scheduled outside the nesting season (September 1 to February 14 for songbirds; September 1 to January 14 for raptors) to avoid potential impacts to nesting birds.

2. Any construction activities that occur during the nesting season (February 15 to August 31 for songbirds; January 15 to August 31 for raptors) will require that all suitable habitat be thoroughly surveyed for the presence of nesting birds by a qualified biologist before commencement of clearing. If any active nests are detected a buffer of 300 feet (500 feet for raptors) around the nest adjacent to construction will be delineated, flagged, and avoided until the nesting cycle is complete. The buffer may be modified and/or other recommendations proposed as determined appropriate by the biological monitor to minimize impacts.

7.2.5 Measures to Mitigate Potentially Significant Impacts to the MSHCP

COA BIO-3 Prior to the issuance of any grading permit the project applicant shall comply with all of the provisions of the MSHCP, including payment of the MSHCP Local Development Mitigation Fee, compliance with Section 6.1.2 of the MSHCP pertaining to Riparian/Riverine Areas, implementation of drainage, toxics and non-native species guidelines pertaining to the Urban/Wildlands Interface in Section 6.1.4 of the MSHCP, and compliance with Section 6.3.2 of the MSHCP pertaining to Burrowing Owl Survey Area requirements. Compliance with Section 6.1.2 of the MSHCP will require preparation of a Determination of Biologically Equivalent or Superior Preservation (DBESP) analysis outlining the impacts and proposed compensatory mitigation for impacts to the Riparian/Riverine Areas for submittal and approval by the City of Moreno Valley and the wildlife agencies (CDFW and USFWS).

8.0 IMPACTS AFTER MITIGATION

8.1 Level of Significance after Mitigation

The proposed project, inclusive of mitigation measures and conditions of approval, would have less than significant impacts to special-status species, jurisdictional features, and migratory and/or nesting birds, in addition to providing MSHCP consistency.

8.2 Cumulative Impacts

Cumulative impacts are defined as the direct and indirect effects of a proposed project which, when considered alone, would not be deemed a substantial impact, but when considered in addition to the impacts of related projects in the area, would be considered significant. "Related projects" refers to past, present, and reasonably foreseeable probable future projects, which would have similar impacts to the proposed Project. CEQA deems a cumulative impact analysis to be adequate if a list of "related projects" is included in the EIR or the proposed project is consistent with an adopted general, specific, master, or comparable programmatic plan [Section 15130(b)(1)(B)]. CEQA also states that no further cumulative impact analysis is necessary for impacts of a proposed project consistent with an adopted general, specific, master, or comparable programmatic plan [Section 15130(d)].

The MSHCP identifies areas for long-term conservation and management. As such, cumulative impacts of proposed projects within authorized take lands are minimized through the conservation of land. Cumulative impacts to the biological resources listed below for the study area are considered to be less than significant based on compliance with the Western Riverside County MSHCP, and regulations for jurisdictional waters. This includes implementation of the mitigation measures and conditions of approval outlined above in section 6.0, *Project Related Impacts* and *7.0, Mitigation Measures and Conditions of Approval*. Since the study area was determined not to function as a regional wildlife movement corridor, this biological resource is not included below.

- Special-status plant species (Parry's spineflower and white-bracted spineflower);
- Burrowing owl;
- Migratory and/or nesting birds; and
- Drainage features (including USACE, RWQCB and CDFW jurisdictional features and MSHCP Riparian/Riverine areas).

The proposed mitigation would result in a minimum no-net-loss of the biological function and value of these resources, and the conditions of approval would ensure compliance with existing regulations (such as the Western Riverside County MSHCP) and regulations for jurisdictional drainages. Therefore, with the proposed mitigation and conditions of approval, impacts would not be considered cumulatively significant. A summary is provided below.

Special-Status Plant Species: Mitigation is proposed and includes a spring focused survey prior to ground disturbance to determine the presence/absence of Parry's spineflower and white-bracted spineflower within the off-site eastern manufactured slope area. If either or both of these species are observed, collection of seed and planting within an on-site or off-site mitigation site is required. The mitigation site is required to be preserved as open space in perpetuity. With this mitigation measure, any impacts to Parry's spineflower and white-bracted spineflower would not be considered cumulatively significant.

Special-Status Wildlife Species: Mitigation is proposed if burrowing owls are observed on the study area in the future, which would avoid direct impacts in compliance with the Western Riverside County MSHCP. Mitigation is also proposed to avoid direct impacts to raptors and migratory bird species through compliance with the MBTA. With these mitigation measures, any impacts would not be considered cumulatively significant.

Jurisdictional Drainages: Impacts to jurisdictional features would be subject to permitting with the regulatory agencies, including USACE, RWQCB and/or CDFW, including compensatory mitigation. With the proposed compliance of existing regulations through the permitting process, impacts would not be considered cumulatively significant.

Riparian/Riverine Areas: Impacts to MSHCP Riparian/Riverine areas would be subject to approval of a DBESP by the City of Moreno Valley and Wildlife Agencies, as required in Section 6.1.2 of the Western Riverside County MSHCP. With the approval and implementation of the DBESP impacts would not be considered cumulatively significant. Mitigation is proposed as compensation for impacts to jurisdictional drainages through the regulatory process as described above.

APPENDIX A - FLORAL AND FAUNAL COMPENDIUM

ANGIOSPERMS (DICOTYLEDONS)

SCIENTIFIC NAME	COMMON NAME
Adoxaceae	**Muskroot Family**
Sambucus nigra ssp. *caerulea*	blue elderberry
Anacardiaceae	**Sumac or Cashew Family**
Rhus ovata	sugar sumac
Asteraceae	**Sunflower Family**
Ambrosia acanthicarpa	flatspine bur ragweed
Artemisia californica	California sagebrush
Artemisia douglasiana	mugwort
Baccharis salicifolia	mule fat
Brickellia desertorum	desert brickellbush
* *Centaurea melitensis*	tocalote
Corethrogyne filaginifolia	common sandaster
Deinandra fasciculata	fascicled tarplant
Encelia farinosa	brittlebush
Ericameria pinifolia	pinebush
Erigeron canadensis	horseweed
* *Helianthus annuus*	common sunflower
Heterotheca grandiflora	telegraphweed
* *Lactuca serriola*	prickly lettuce
* *Oncosiphon piluliferum*	stinknet
Pseudognaphalium bicolor	bicolored cudweed
* *Salsola tragus*	prickly Russian thistle
Stephanomeria virgata	rod wirelettuce
Boraginaceae	**Borage Family**
Amsinckia intermedia	common fiddleneck
Phacelia cicutaria	caterpillar phacelia
Brassicaceae	**Mustard Family**
* *Hirschfeldia incana*	short pod mustard
* *Raphanus raphanistrum*	wild radish
* *Sisymbrium irio*	London rocket
Sisymbrium sp.	mustard

** non-native*

ANGIOSPERMS (DICOTYLEDONS)

SCIENTIFIC NAME		COMMON NAME
Cactaceae		**Cactus Family**
	Cylindropuntia californica var. *parkeri*	cane cholla
	Opuntia littoralis	coast prickly pear
Chenopodiaceae		**Goosefoot Family**
*	*Chenopodium murale*	nettle-leaved goosefoot
Convolvulaceae		**Morning-Glory Family**
*	*Convolvulus arvensis*	field bindweed
Cucurbitaceae		**Gourd Family**
	Cucurbita palmata	coyote gourd
	Marah macrocarpa	wild cucumber
Cuscutaceae		**Dodder Family**
	Cuscuta sp.	dodder
Euphorbiaceae		**Spurge Family**
	Croton setigerus	dove weed
	Euphorbia albomarginata	rattlesnake weed
Fabaceae		**Legume Family**
	Acmispon americanus	Spanish lotus
	Acmispon glaber var. *glaber*	deerweed
Geraniaceae		**Geranium Family**
*	*Erodium botrys*	longbeak stork's bill
*	*Erodium cicutarium*	red-stemmed filaree
Lamiaceae		**Mint Family**
*	*Marrubium vulgare*	horehound
	Salvia apiana	white sage
	Salvia columbariae	chia
	Salvia mellifera	black sage
	Trichostema lanceolatum	vinegarweed
Malvaceae		**Mallow Family**
*	*Malva parviflora*	cheeseweed
Myrtaceae		**Myrtle Family**
*	*Eucalyptus camaldulensis*	red gum
*	*Eucalyptus citriodora*	lemon scented gum
Nyctaginaceae		**Four O'Clock Family**
	Mirabilis laevis	wishbone bush

* *non-native*

ANGIOSPERMS (DICOTYLEDONS)

SCIENTIFIC NAME	COMMON NAME
Polygonaceae	**Buckwheat Family**
Eriogonum fasciculatum	California buckwheat
Salix gooddingii	black willow
Scrophulariaceae	**Figwort Family**
Antirrhinum nuttallianum	Nuttall's snapdragon
Scrophularia californica	California figwort
Solanaceae	**Nightshade Family**
Datura wrightii	jimsonweed
* *Nicotiana glauca*	tree tobacco
Solanum douglasii	Douglas' nightshade
Solanum xanti	purple nightshade
Zygophyllaceae	**Caltrop Family**
* *Tribulus terrestris*	puncturevine

ANGIOSPERMS (MONOCOTYLEDONS)

SCIENTIFIC NAME	COMMON NAME
Arecaceae	**Palm Family**
* *Washingtonia robusta*	Mexican fan palm
Liliaceae	**Lily Family**
Chlorogalum pomeridianum	soap plant
Poaceae	**Grass Family**
* *Arundo donax*	giant reed
* *Avena fatua*	wild oat
* *Bromus diandrus*	ripgut grass
* *Bromus madritensis* ssp. *rubens*	foxtail chess
* *Festuca perennis*	Italian ryegrass
* *Hordeum vulgare*	barley
* *Lamarckia aurea*	goldentop
* *Polypogon monspeliensis*	annual beard grass
* *Schismus barbatus*	Mediterranean schismus

** non-native*

REPTILES

SCIENTIFIC NAME	COMMON NAME
Colubridae	**Colubrid Snakes**
Coluber flagellum	coachwhip
Phrynosomatidae	**Zebratail, Earless, Horned, Spiny, Fringe-Toed Lizards**
Sceloporus occidentalis	western fence lizard

BIRDS

SCIENTIFIC NAME		COMMON NAME
Cathartidae		**New World Vultures**
	Cathartes aura	*turkey vulture*
Accipitridae		**Hawks**
	Accipiter cooperii	*Cooper's hawk*
	Buteo jamaicensis	*red-tailed hawk*
Falconidae		**Falcons**
	Falco sparverius	*American kestrel*
Charadriidae		**Plovers**
	Charadrius vociferus	*killdeer*
Columbidae		**Pigeons and Doves**
*	*Columba livia*	*rock pigeon*
	Zenaida macroura	*mourning dove*
Apodidae		**Swifts**
	Aeronautes saxatalis	*white-throated swift*
Trochilidae		**Hummingbirds**
	Archilochus alexandri	*black-chinned hummingbird*
	Calypte anna	*Anna's hummingbird*
Picidae		**Woodpeckers**
	Picoides nuttallii	*Nuttall's woodpecker*
Tyrannidae		**Tyrant Flycatchers**
	Sayornis nigricans	*black phoebe*
	Sayornis saya	*Say's phoebe*
	Tyrannus verticalis	*western kingbird*
	Tyrannus vociferans	*Cassin's kingbird*
Laniidae		**Shrikes**
	Lanius ludovicianus	*loggerhead shrike*

* *non-native*

BIRDS

SCIENTIFIC NAME		COMMON NAME
Corvidae		**Jays and Crows**
	Corvus brachyrhynchos	*American crow*
Alaudidae		**Larks**
	Eremophila alpestris	*horned lark*
Hirundinidae		**Swallows**
	Petrochelidon pyrrhonota	*cliff swallow*
	Hirundo rustica	*barn swallow*
	Stelgidopteryx serripennis	*northern rough-winged swallow*
Aegithalidae		**Bushtits**
	Psaltriparus minimus	*bushtit*
Polioptilidae		**Gnatcatchers**
	Polioptila californica californica	*coastal California gnatcatcher*
Sturnidae		**Starlings**
*	*Sturnus vulgaris*	*European starling*
Emberizidae		**Emberizine Sparrows and Allies**
	Melozone crissalis	*California towhee*
Icteridae		**Blackbirds**
	Agelaius phoeniceus	*red-winged blackbird*
Fringillidae		**Finches**
	Haemorhous mexicanus	*house finch*
	Spinus psaltria	*lesser goldfinch*
	Spinus tristis	*American goldfinch*
Passeridae		**Old World Sparrows**
*	*Passer domesticus*	*house sparrow*

MAMMALS

SCIENTIFIC NAME	COMMON NAME
Sylvilagus audubonii sanctidiegi	Audubon's cottontail

* *non-native*

APPENDIX B: SPECIAL-STATUS PLANT SPECIES

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
BRYOPHYTES								
Bryaceae	**Moss Family**							
Tortula californica	California screw moss	N/A	NONE	NONE	1B.2	NONE	Sandy soil. Chenopod scrub, Valley and foothill grassland. 10-1460 meters.	**ABSENT**
ANGIOSPERMS (DICOTS)								
Asteraceae	**Sunflower Family**							
Ambrosia pumila	San Diego ambrosia	Apr.-Oct.	FE	NONE	1B.1	MSHCP(b)	Chaparral, coastal scrub, valley and foothill grassland, vernal pools; often in disturbed areas; sometimes alkaline sandy loam or clay soils. 20-415 meters.	**NONE**
Artemisia palmeri	San Diego sagewort	May-Sep.	NONE	NONE	4.2	MSHCP	Coastal scrub, chaparral, riparian forest, riparian woodland, riparian scrub; found in sandy soils within drainages and riparian areas. 15-915 meters.	**NONE**
Centromadia pungens ssp. *laevis*	smooth tarplant	Apr.-Sep.	NONE	NONE	1B.1	MSHCP(d)	Chenopod scrub, meadows and seeps, playas, riparian woodland, valley and foothill grassland; alkaline. 0-640 meters.	**ABSENT**
Deinandra paniculata	paniculate tarplant	Apr.-Nov.	NONE	NONE	4.2	NONE	Generally vernally mesic; coastal scrub; valley and foothill grassland; vernal pools 25-940 meters.	**NONE**
Helianthus nuttallii ssp. *parishii*	Los Angeles sunflower	Aug.-Oct.	NONE	NONE	1A	NONE	Freshwater marsh, salt marsh. 10-1675 meters.	**NONE**
Lasthenia glabrata ssp. *coulteri*	Coulter's goldfields	Feb.-Jun.	NONE	NONE	1B.1	MSHCP(d)	Marshes and swamps (coastal salt), playas, vernal pools. 1-1220 meters.	**NONE**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
Senecio astephanus	San Gabriel ragwort	May-Jul.	NONE	NONE	4.3	NONE	Chaparral, coastal bluff scrub; rocky slopes. 400-1500 meters.	**NONE**
Symphyotrichum defoliatum	San Bernardino aster	Jul.-Nov.	NONE	NONE	1B.2	NONE	Cismontane woodland; coastal scrub; lower montane coniferous forest; meadows and seeps; marshes and swamps; valley and foothill grassland (vernally mesic); near ditches, streams and springs. 2-2040 meters.	**ABSENT**
Trichocoronis wrightii var. *wrightii*	Wright's trichocoronis	May-Sep.	NONE	NONE	2B.1	MSHCP(b)	Meadows and seeps, marshes and swamps, riparian scrub, vernal. 5-435 meters.	**NONE**
Aspleniaceae	**Spleenwort Family**							
Asplenium vespertinum	western spleenwort	Mar.-Jun.	NONE	NONE	4.2	NONE	Sandy soils in low-gradient washes, alluvial terraces, and canyon bottoms, along gravelly wash margins, or on coarse soils on steep, generally north-facing slopes in alluvial scrub, cismontane (e.g., chamise) chaparral, coastal sage scrub, oak woodland, and/or riparian scrub or woodland. 274 - 825 meters.	**NONE**
Berberidaeeae	**Barberry Family**							
Berberis nevinii	Nevin's barberry	Mar.-Jun.	FE	SE	1B.1	MSHCP(d)	Sandy soils in low-gradient washes, alluvial terraces, and canyon bottoms, along gravelly wash margins, or on coarse soils on steep, generally north-facing slopes in alluvial scrub, cismontane (e.g., chamise) chaparral, coastal sage scrub, oak woodland, and/or riparian	**ABSENT**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
							scrub or woodland. 274 - 825 meters.	
Nasturtium gambelii	Gambel's water cress	Apr.-Oct.	FE	ST	1B.1	NONE	Marshes or swamps. 5-330 meters.	**NONE**
Boraginaceae	**Borage Family**							
Harpagonella palmeri	Palmer's grapplinghook	Mar.-May	NONE	NONE	4.2	MSHCP	Chaparral, coastal scrub, valley and foothill grassland; open grassy areas within shrubland; clay soils. 20-955 meters.	**NONE**
Brassicaceae	**Mustard Family**							
Caulanthus simulans	Payson's jewel-flower	Feb.-Jun.	NONE	NONE	4.2	MSHCP	Chaparral, coastal scrub; sandy, granitic soils. 90-2200 meters.	
Lepidium virginicum var. robinsonii	Robinson's pepper-grass	Jan.-Jul.	NONE	NONE	4.3	NONE	Chaparral, coastal scrub; shrubland; dry soils. 1-885 meters.	**NONE**
Cactaceae	**Cactus Family**							
Opuntia basilaris var. brachyclada	short-joint beavertail	Apr.-Jun.	NONE	NONE	1B.2	NONE	Chaparral, Joshua tree woodland, Mojavean desert scrub, pinyon-juniper woodland, riparian woodland; sandy or granitic soils. 425-1800 meters.	**NONE**
Caryophyllaceae	**Pink Family**							
Arenaria paludicola	marsh sandwort	May-Aug.	FE	SE	1B.1	NONE	Marshes and swamps (freshwater); grows through dense areas of *Typha*, *Juncus*, and *Scirpus*; found in sandy soils. 3-170 meters.	**NONE**
Chenopodiaceae	**Saltbush Family**							
Atriplex coronata var. *notatior*	San Jacinto Valley crownscale	Apr.-Aug.	FE	NONE	1B.1	MSHCP(d)	Alkaline flats, playas, valley and foothill grassland, vernal pools. 139-500 meters.	**NONE**
Atriplex pacifica	South Coast saltscale	Mar.-Oct.	NONE	NONE	1B.2	NONE	Coastal bluff scrub, Coastal dunes, Coastal scrub, Playas. 0-140 meters.	**NONE**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
Atriplex parishii	Parish's brittlescale	Jun.-Oct.	NONE	NONE	1B.1	MSHCP(d)	Shadscale scrub, alkali sinks, freshwater wetlands, wetland-riparian; playas, vernal pools. 25-1900 meters.	**NONE**
Atriplex serenana var. *davidsonii*	Davidson's saltscale	Apr.-Oct.	NONE	NONE	1B.2	MSHCP(d)	Coastal sage scrub, wetland-riparian; coastal. 10-200 meters	**NONE**
Convolvulaceae	**Morning-glory Family**							
Convolvulus simulans	small-flowered morning-glory	Mar.-Jul.	NONE	NONE	4.2	MSHCP(e)	Clay soils, serpentinite seeps; openings in chaparral; coastal sage scrub; valley and foothill grassland. 30-700 meters.	**NONE**
Cuscuta obtusiflora var. *glandulosa*	Peruvian dodder	Jul.-Oct.	NONE	NONE	2B.2	NONE	Marshes and swamps (freshwater). 15-280 meters.	**NONE**
Fabaceae	**Pea Family**							
Astragalus hornii var. hornii	Horn's milk-vetch	May-Oct.	NONE	NONE	1B.1	MSHCP	Meadows and seeps, playas, lake margins; alkali soils. 60-850 meters.	**NONE**
Astragalus pachypus var. jaegeri	Jaeger's bush milk-vetch	Dec.-Jun.	NONE	NONE	1B.1	MSHCP	Coastal scrub, chaparral, valley and foothill grassland, cismontane woodland; dry habitats, such as ridges, valleys, and sandy slopes, typically within grasslands and oak chaparral. 365-915 meters.	**ABSENT**
Rupertia rigida	Parish's rupertia	Jun.-Aug.	NONE	NONE	4.3	NONE	Chaparral, lower montane coniferous forest, cismontane woodland, meadows and seeps, pebble plain, valley and foothill grassland. 700-2500 meters	**NONE**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
Geraniaceae	**Geranium Family**							
California macrophylla	round-leaved filaree	Mar.-May	NONE	NONE	1B.1	MSHCP(d)	Cismontane woodland, valley and foothill grassland; clay. 15-1200 meters.	**ABSENT**
Grossulariaceae	**Gooseberry Family**							
Ribes divaricatum var. parishii	Parish's gooseberry	Feb.-Apr.	NONE	NONE	1A	NONE	Riparian woodland. 65-300 meters.	**NONE**
Hydrophyllaceae	**Waterleaf Family**							
Nama stenocarpa	mud nama	Jan.-Jul.	NONE	NONE	2.B2	MSHCP(d)	Marches and swamps (lake margins, riverbanks). 5-500 meters.	**NONE**
Juglandaceae	**Walnut Family**							
Juglans californica	California black walnut	Mar.-Jun.	NONE	NONE	4.2	MSHCP	Chaparral, coastal scrub, cismontane woodland, slopes, canyons, alluvial habitats. 50-900 meters.	**NONE**
Juglandaceae	**Walnut Family**							
Lepechinia cardiophylla	heart-leaved pitcher sage	Apr.-Jul.	NONE	NONE	1B.2	MSHCP(d)	Closed-cone coniferous forest, chaparral, cismontane woodland. 520-1370 meters.	**NONE**
Monardella macrantha ssp. *hallii*	Hall's monardella	Jun.-Oct.	NONE	NONE	1B.3	MSHCP	Broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, valley and foothill grassland. 730-2195 meters.	**NONE**
Monardella pringlei	Pringle's monardella	May-Jun.	NONE	NONE	1A	NONE	Coastal scrub; sandy soils. 300-400 meters.	**NONE**
Juncaceae	**Rush Family**							
Juncus duranii	Duran's rush	Jul.-Aug.	NONE	NONE	4.3	NONE	Meadows, lower and upper montane coniferous forest; wet areas. 1770-2805 meters.	**NONE**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
Malvaceae	**Stick-leaf Family**							
Malacothamnus parishii	Parish's bush-mallow	Jun.-Jul.	NONE	NONE	1A	NONE	Chaparral, coastal sage scrub; in washes. 305-455 meters.	**NONE**
Sidalcea hickmanii ssp. parishii	Parish's checkerbloom	Jun.-Aug.	NONE	SR	1B.2	NONE	Chaparral, cismontane woodland, lower montane coniferous forest; typically found in burned or cleared areas on dry, rocky hillsides and along edges of fire roads. 1000-2500 meters.	**NONE**
Sidalcea neomexicana	salt spring checkerbloom	Mar.-Jun.	NONE	NONE	2B.2	NONE	Chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, playas/alkaline, mesic. 15-1530 meters.	**ABSENT**
Nyctaginaceae	**Four O'Clock Family**							
Abronia villosa var. *aurita*	chaparral sand-verbena	Jan.-Sep.	NONE	NONE	1B.1	NONE	Chaparral, coastal scrub, desert dunes; sandy. 75-1600 meters.	**ABSENT**
Orobanchaceae	**Broom-rape Family**							
Chloropyron maritimum ssp. maritimum	salt marsh bird's-beak	May-Oct.	FE	SE	1B.2	NONE	Coastal salt marsh, coastal dunes; limited to the higher zones of the salt marsh habitat 0-30 meters.	**NONE**
Papaveraceae	**Poppy Family**							
Romneya coulteri	Coulter's matilija poppy	Mar.-Jul.	NONE	NONE	4.2	MSHCP(e)	Dry washes and canyons in sage scrub and chaparral. 20-1200 meters.	**NONE**
Polemoniaceae	**Phlox Family**							
Eriastrum densifolium ssp. sanctorum	Santa Ana River woollystar	Apr.-Sep.	FE	SE	1B.1	MSHCP	Chaparral, coastal scrub (alluvial fan); sandy or gravelly soils. 91-610 meters.	**NONE**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Scientific Name	Common Name	Flowering Period	Federal	State	CNPS	MSHCP	Preferred Habitat	Potential For Occurrence
Navarretia fossalis	spreading navarretia	Apr.-Jun.	FT	NONE	1B.1	MSHCP(b)	Coastal sage scrub, wetland-riparian; occurs almost always under natural conditions in wetlands. 30-655 meters.	**NONE**
Polygonaceae	**Buckwheat Family**							
Chorizanthe leptotheca	Peninsular spineflower	May-Aug.	NONE	NONE	4.2	MSHCP(e)	Chaparral, coastal scrub, lower montane coniferous forest; granitic soils and alluvial fans. 300-1900 meters.	**NONE**
Chorizanthe parryi var. *parryi*	Parry's spineflower	Apr.-Jun.	NONE	NONE	1B.1	MSHCP(e)	Chaparral, cismontane woodland, coastal scrub, valley and foothill grassland; sandy or rocky, openings. 275-1220 meters.	**ABSENT** However, there is a potential for this species to occur within the off-site manufactured slope area east of the project boundary.
Chorizanthe polygonoides var. *longispina*	long-spined spineflower	Apr.-Jul.	NONE	NONE	1B.2	MSHCP	Chaparral, coastal scrub, meadow and seep, valley and foothill grassland, vernal pools; ultramafic, often clay. 30-1530 meters.	**ABSENT**
Chorizanthe xanti var. leucotheca	white-bracted spineflower	Apr.-June	NONE	NONE	1B.2	NONE	Coastal scrub(alluvial fans), Mojavean desert scrub, pinyon and juniper woodland; sandy or gravelly soils. 300-1200 meters.	**ABSENT** However, there is a potential for this species to occur within the off-site manufactured slope area east of the project boundary.
Dodecahema leptoceras	slender-horned spineflower	Apr.-Jun.	FE	SE	1B.1	MSHCP(b)	Chaparral, cismontane woodland, coastal scrub (alluvial fan); sandy. 200-760 meters.	**NONE**
Ranunculaceae	**Buttercup Family**							
Myosurus minimus ssp. *apus*	little mousetail	Mar.-Jun.	NONE	NONE	3.1	MSHCP(d)	Associated with vernal pools and inundated grassland habitats.	**NONE**

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

NONE = species not expected to occur on the study area due to the lack of suitable habitat, or the site's location outside of the species' range; **ABSENT** = preferred habitat was considered present based on the literature review and observed habitat on the study area, however no individuals were observed during the focused sensitive plant survey.

Appendix C: Special-Status Wildlife Species

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
INVERTEBRATES						
ANOSTRACA	**Fairy Shrimp**					
Streptocephalus woottoni	Riverside fairy shrimp	FE	NONE	MSHCP(a)	Endemic to western Riverside, Orange and San Diego Counties In areas of tectonic swales and slump basins in grassland and coastal scrub. Inhabit seasonal pools filled by winter/spring rains. Hatch in warm water later in the season.	**NONE** No suitable habitat.
Diptera	**Flies**					
Rhaphiomidas terminatus abdominalis	Delhi Sands flower-loving fly	FE	NONE	MSHCP	Found in areas of the Delhi Sands formation in southwestern San Bernardino and northwestern Riverside Counties. Requires fine, sandy soils, often with wholly or partly consolidated dunes and sparse vegetation.	**NONE** No suitable habitat. Although the study area is in the species range, Delhi Sands soils were not mapped by NRCS. Additionally, the majority of the site is highly disturbed.
Lepidoptera	**Butterflies and Moths**					
Euphydryas editha quino	quino checkerspot butterfly	FE	NONE	MSHCP	Chaparral and coastal scrub with sunny clearings. Require high densities of host plants, cuhs as *Plantago erecta*, *P. insularis*, and *Orthocarpus purpurescens*.	**NONE** No host species.
FISHES						
Catostomidae	**Suckers**					
Catostomus santaanae	Santa Ana sucker	FT	NONE	MSHCP	Habitat generalists, but prefer sand-rubble-boulder bottoms,	**NONE**

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
					cool, clear water, & algae.	No suitable habitat.
Cyprinidae	**Carps and Minnows**					
Gila orcutti	arroyo chub	NONE	SSC	MSHCP	Aquatic and south coast flowing waters; slow water stream sections with mud or sand bottoms; feeds heavily on aquatic vegetation and associated invertebrates.	**NONE** No suitable habitat.
Rhinichthys osculus ssp. *3*	Santa Ana speckled dace	NONE	SSC	NONE	Aquatic and south coast flowing waters. Prefer stony habitat where there are hiding spaces between stones, washed by moderate current.	**NONE** No suitable habitat.
AMPHIBIANS						
Ranidae	**True Frogs**					
Rana muscosa	southern mountain yellow-legged frog	FE, FSS	SSC	MSHCP(d)	Prefers rocky stream courses in the mountains of southern California. Inhabits mid- to upper-elevation, perennial streams, often in locations with bedrock pools. Always encountered within a few feet of water.	**NONE** No suitable habitat.
Scaphiopodidae	**North American Spadefoots**					
Spea hammondii	western spadefoot	NONE	SSC	MSHCP	Prefers burrow sites within relatively open areas in lowland grasslands, chaparral, and pine-oak woodlands, areas of sandy or gravelly soil in alluvial fans, washes, and floodplains.	**NONE** No suitable habitat.

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
					Requires temporary pools for reproduction.	
REPTILES						
Anniellidae	**Legless Lizards**					
Anniella pulchra pulchra	silvery legless lizard	NONE	SSC	NONE	Sparse vegetation in beach, chaparral, and pine-oak woodland habitats as well as sycamores, cottonwoods, and oaks growing adjacent to streams. Needs loose soil for burrowing, moisture, warmth, and plant cover. Requires moisture.	**NONE** No suitable habitat.
Colubridae	**Colubrid Snakes**					
Lampropeltis zonata parvirubra	California mountain kingsnake (San Bernardino population)	NONE	SSC	MSHCP(f)	Well-lit canyons with rocky outcrops or rocky talus.	**NONE** No suitable habitat. Although the study area supports two small areas with rock outcrops, the outcrops are interspersed with vegetation and surrounded by unsuitable habitat. The study area also lacks rocky talus and is not within a canyon, which are both habitat features preferred by this species. The only CNDDB occurrence record in the vicinity is from 1997 on near Mill Creek off of SR-38, approximately 14.25 miles to the northeast of the study area.
Thamnophis hammondii	two-striped garter snake	NONE	SSC	NONE	Riparian and freshwater marshes with perennial water.	**NONE** No suitable habitat.

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
Emydidae	**Box and Water Turtles**					
Emys marmorata	western pond turtle	NONE	SSC	MSHCP	Aquatic environments; artificial flowing waters; marsh and swamp; south coast flowing and standing waters; wetlands. Requires upland habitat up to 0.5 km from water for egg laying and sandy banks or open fields for basking.	**NONE** No suitable habitat.
Phrynosomatidae	**Zebratail, Earless, Horned, Spiny, Fringe-Toed Lizards**					
Phrynosoma blainvillii	coast horned lizard	NONE	SSC	MSHCP	Chaparral; cismontane woodland; coastal bluff scrub; coastal scrub; desert wash; pinyon and juniper woodlands; riparian scrub; riparian woodland; valley and foothill grassland. Requires opens areas for basking, bushes for cover, loose soil for burrowing, and insects for food.	**POTENTIAL [MODERATE]** The majority of potentially suitable habitat resides on the northwestern corner of study area where Riversidean sage scrub and brittlebush scrub occurs. Harvester ants, this species main food source, were also observed (although the food source was not observed in the area supporting suitable habitat). Although suitable habitat and a possible food source exists on the study area, the majority is disturbed and higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the study area. There are numerous CNDDB occurrence records for this species within the vicinity of the study area.

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
Teiidae	**Whiptail Lizards**					
Aspidoscelis hyperythra	orange-throated whiptail	NONE	SSC	MSHCP	Chaparral; cismontane woodland; coastal scrub. Typically found along washes and other sandy sites. Requires perennial plants that host termites.	**POTENTIAL [MODERATE]** The majority of potentially suitable habitat resides on the northwestern corner of the study area where Riversidean sage scrub and brittlebush scrub occurs. These areas support perennial plants that may host this species preferred food source (termites). Although suitable habitat and a possible food source exists on the study area, the majority is disturbed and higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the study area. There are numerous CNDDB occurrence records for this species within the vicinity of the study area.
Viperidae	**Vipers**					
Crotalus ruber	red diamond rattlesnake	None	SSC	MSHCP	Chaparral, woodland, and arid desert habitats in rocky areas with dense vegetation.	**POTENTIAL [MODERATE]** The majority of potentially suitable habitat resides on the northwestern corner of study area where Riversidean sage scrub and brittlebush scrub occurs. However, these areas support limited vegetation and crevices for cover required by this species and higher quality habitat is present to the northwest (Olive Hill and Reche Canyon) and northeast (the Badlands mountain range) of the

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
						study area. There are numerous CNDDB occurrence records for this species within the vicinity of the study area.
BIRDS						
Accipitridae	**Hawks**					
Aquila chrysaetos	golden eagle	NONE	SFP	MSHCP	Mountains, deserts, and open country; prefer to forage over grasslands, deserts, savannahs and early successional stages of forest and shrub habitats.	**NONE (N); POTENTIAL(F, LOW)** There are few trees are present on the site, primarily near the western boundary in the laurel sumac scrub/ ruderal community. However, this species typically prefers to nest on cliffs, which are not present. This species is not expected to nest on the study area since it is highly disturbed, preferred nesting habitat is not present, and no records of nesting occur. There were some small mammal burrows observed in the disturbed areas of the study area, which could potentially provide a food source. However, there is only 1 CNDDB occurrence record within the vicinity. This record was a breeding pair observed in fall 1979, spring 1980, and fall 1980 in San Timoteo Canyon, approximately 6.0 miles to the northeast.
Buteo swainsoni	Swainson's hawk	NONE	ST	MSHCP	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands	**NONE (N); POTENTIAL (F, LOW)** There are a few trees present on the study area, primarily near the

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
					with groves or lines of trees. Requires suitable foraging areas adjacent to breading areas such as grasslands that support rodent populations. This species will also hunt for reptiles and occasionally insects.	western boundary in the laurel sumac scrub/ ruderal community. However, these trees are limited and directly adjacent to roads and residential homes, which could create some noise disturbance. Disturbed areas supply open space with some potentially suitable habitat for burrowing animals and insects, and therefore may provide a food source for this species. There are only 2 CNDDB occurrence records of nesting individuals within the vicinity, both from over 100 years ago.
Elanus leucurus	white-tailed kite	NONE	SFP	MSHCP	Cismontane woodland; marsh and swamp; riparian woodland; valley and foothill grassland; wetland. Requires open grasslands, meadows, or marshes for foraging near isolated full-canopied trees for nesting.	**NONE (N); NONE (F)** No suitable habitat.
Haliaeetus leucocephalus	bald eagle	NONE	SE	MSHCP	Lower montane coniferous forest; old growth.	**NONE (N); NONE (F)** No suitable habitat.
Cuculidae	**Cuckoos, Roadrunners, and Anis**					
Coccyzus americanus occidentalis	western yellow-billed cuckoo	FC	SE	MSHCP(a)	Riparian thickets and forests dominated by willows abutting slow-moving watercourses, backwaters, or seeps.	**NONE (N); NONE (F)** No suitable habitat.

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

POTENTIAL = Preferred habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (N) = Preferred nesting or roosting habitat was considered potentially present based on the literature review and observed habitat in the study area.

POTENTIAL (F) = Preferred foraging habitat was considered potentially present based on the literature review and observed habitat in the study area.

OBSERVED = Species was observed during surveys conducted on the site.

Scientific Name	Common Name	Federal	State	MSHCP	Preferred Habitat	Potential For Occurrence
Strigidae	**True Owls**					
Athene cunicularia	burrowing owl	None	SSC	MSHCP(c)	Disturbed; low-growing vegetation within coastal prairie, coastal scrub, Great Basin scrub, Mojavean desert scrub, Sonoran desert scrub, valley and foothill grassland; bare ground, disturbed.	**Not expected** Potentially suitable habitat present. Presence/absence surveys conducted with no BUOW observed.
Asio otus	long-eared owl	None	SSC	None	Riparian bottomlands with tall willows & cottonwoods; also found in live oak patches along streams. Require adjacent open land with mice and old nests of crows, hawks, or magpies for breeding.	**None (N); None (F)** No suitable habitat.
Tyrannidae	**Tyrant Flycatchers**					
Empidonax traillii extimus	southwestern willow flycatcher	FE	SE	MSHCP(a)	Wet meadows, riparian woodlands that contain water and low growing willow thickets.	**None (N); None (F)** No suitable habitat.
Laniidae	**Shrikes**					
Lanius ludovicianus	loggerhead shrike	None	SSC	MSHCP	Broken woodlands, savannah, pinyon-juniper, Joshua tree, & riparian woodlands, desert oases, scrub & washes; open country with perches for hunting and relatively dense shrubs for nesting.	**Potential (N, Moderate); Observed (F)** This species was observed during the third BUOW survey (7/2/2015).
Vireonidae	**Vireos**					
Vireo bellii pusillus	least Bell's vireo	FE	SE	MSHCP(a)	Riparian forest; riparian scrub; riparian woodland.	**None (N); None (F)** No suitable habitat.

NONE = Species not expected to occur due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (N) = Species not expected to nest or roost due to the lack of suitable habitat, or the site's location is outside of the species' range.

NONE (F) = Species not expected to forage due to lack of food sources, or the site's location is outside of the species' range.

NOT EXPECTED = Preferred habitat was considered potentially present based on the literature review and anticipated habitat in the study area, however no individuals were observed and/or suitable habitat was absent based on the general field survey or focused surveys.

2015 Burrowing Owl Focused Survey Report

PCR

August 3, 2015

Mr. Joseph Rivani
GLOBAL INVESTMENT & DEVELOPMENT
3470 Wilshire Boulevard, Suite 1020
Los Angeles, CA 90010

Re: RESULTS OF FOCUSED BURROWING OWL SURVEYS FOR THE IRONWOOD PROJECT, CITY OF MORENO VALLEY, RIVERSIDE COUNTY, CALIFORNIA

Dear Mr. Rivani:

This report summarizes the methodology and findings of focused burrowing owl (*Athene cunicularia*) (BUOW) surveys conducted by **PCR Services Corporation (PCR)** for the approximately 83-acre property located directly northeast of Ironwood Avenue and Nason Street (APN 473-160-004) ("project site") located in the City of Moreno Valley, Riverside County, California. The surveys encompassed the project site and a 500-foot survey buffer surrounding the perimeter of the project site where suitable habitat was present. The surveys were conducted in accordance with the County of Riverside's 2006 *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*.[1]

PROJECT SITE DESCRIPTION

The approximately 83-acre project site is generally situated east of Interstate 10 (I-10) and north of State Route 60 (SR 60), as shown in **Figure 1**, *Regional Map*. Specifically, the project site is located northwest of the intersection of Ironwood Avenue and Nason Street. The project site is depicted on the U.S. Geological Survey (USGS) 7.5' Sunnymead topographic quadrangle map, Section 34, T. 2 S., R. 3 W., as shown in **Figure 2**, *Vicinity Map*. The topography of the project site is generally flat with gently rolling hills throughout and steep rocky hillsides along the northwestern portion of the project site. Elevations on the project site range from approximately 1,975 feet above mean sea level (MSL) along the northwestern boundary of the project site, to approximately 1,830 feet above MSL along the southern boundary of the project site. Surrounding land uses include residential development to the south, northeast, and west and undeveloped land to the north and southeast.

[1] *County of Riverside. 2006. Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area.*

PCR

PLANT COMMUNITIES

The project site consists primarily of large ruderal areas. Plant communities found on the project site include brittlebush scrub, Riversidean sage scrub, rock outcrop/Riversidean sage scrub, brittlebush scrub/ruderal, laurel sumac scrub/ruderal, ruderal/Riversidean sage scrub, river wash, ruderal, disturbed, and developed. A brief summary of each plant community within the project site in which surveys were conducted is discussed below.

Brittlebush Scrub/Ruderal

Brittlebush scrub is a drought tolerant subtype of Riversidean Sage Scrub in which the dominate plant is brittlebush (*Encelia farinosa*). Additional native species within the brittlebush scrub community include California buckwheat (*Eriogonum fasciculatum*), California sagebrush (*Artemisia californica*), and chia (*Salvia columbariae*). Ruderal vegetation is also found within this community. Brittlebush scrub/ruderal areas occupy 0.29 acre throughout the project site.

River Wash

River wash consists of prevailingly course-textured but variable material, ranging from sand to gravel. Sparse vegetation within the river wash includes giant reed (*Arundo donax*), telegraph weed (*Heterotheca grandiflora*), doveweed, and Russian thistle (*Salsola tragus*). River wash occupies 0.03 acre throughout the project site.

Ruderal/Riversidean Sage Scrub

Ruderal/Riversidean sage scrub within the project site is heavily disturbed and is dominated by ruderal vegetation. Non-native species observed within this community include shortpod mustard (*Hirschfeldia incana*), foxtail chess (*Bromus madritensis*), and red-stemmed filaree (*Erodium cicutarium*). Native species found within this community include brittlebush (*Encelia farinosa*), California buckwheat, California sagebrush, common sunflower (*Helianthus annuus*), deerweed (*Acmispon glaber*), and pinebush (*Ericameria pinifolia*). Ruderal/Riversidean sage scrub occupies 1.31 acres throughout the project site.

Ruderal

Ruderal vegetation is found in areas heavily disturbed by human activities, such as roadsides, graded fields, and manufactured slopes. Within the project site, non-native species observed within this community include shortpod mustard, foxtail chess, red-stemmed filaree, ripgut brome (*Bromus diandrus*), and native species such as doveweed (*Croton setigerus*), common fiddleneck (*Amsinckia*

PCR

intermedia), and cudweed aster (*Corethrogyne filaginifolia*). Ruderal areas occupy 39.08 acres throughout the project site.

Disturbed

Disturbed areas consist of areas heavily disturbed by human activities, including dirt roads with little to no vegetation. Disturbed areas occupy 31.23 acres throughout the project site.

Developed

Developed areas consist of man-made structures such as homes and buildings, and these areas comprise 1.64 acres throughout the project site.

METHODOLOGY

Step I - Habitat Assessment

The surveys were conducted in accordance with the County of Riverside's 2006 *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*.[2] During the Step I Habitat Assessment, suitable habitat was identified on-site during the field survey, including disturbed, low-growing vegetation; bare ground; and small fossorial mammal burrows.

Step II – Locating Burrows and Burrowing Owls

Step II surveys were conducted within the project site plus an approximately 500-foot survey buffer around the project site perimeter. Surveys focused on the detection of small fossorial mammal burrows potentially suitable for BUOW, BUOW burrows, individual BUOW, and any diagnostic sign of their occurrence (e.g., molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance). Off-site areas within the 500-foot survey buffer were surveyed by foot where accessible, or with the use of binoculars in areas which were inaccessible.

Surveys were conducted on May 13, June 3, July 2, and July 27, 2015 by PCR biologists Ezekiel Cooley, Amy Lee, and Lauren Singleton. Surveys consisted of four site visits, on four separate days, and were conducted between one hour prior to and two hours after sunrise during suitable weather conditions. Transects were utilized in all accessible areas, spaced no more than 100

---

[2] *County of Riverside. 2006. Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area.*

feet apart, to allow for 100 percent visibility (**Figure 3**, *Transect Map*, attached). In addition, observations were made with the use of binoculars. Weather conditions consisted of hazy to cloudy skies with winds between 0 and 5 miles per house (mph) and air temperatures ranging from 52° to 76° Fahrenheit. Survey data is presented in **Table 1**, *Survey Data*, below.

Table 1

Survey Data

Date	Time	Wind (mph) (start/end)	Temperature (F) (start-end)	Weather (start-end)	Results	Surveyor
05/13/15	0615 – 0820	1-2/2-5	52° – 61°	70% Cloud Cover – 60% Cloud Cover	No BUOW or BUOW sign	Cooley, Lee, Singleton
06/03/15	0600 – 0800	1-3/0-1	55° – 57°	100% Cloud Cover – 100% Cloud Cover	No BUOW or BUOW sign	Cooley, Lee, Singleton
07/02/15	0545 – 0730	0-1/0-1	72° – 76°	60% Cloud Cover – 80% Cloud Cover	No BUOW or BUOW sign	Cooley, Lee, Singleton
07/27/15	0600 – 0730	0-1/0-1	62°– 66°	100% Cloud Cover – 100% Cloud Cover	No BUOW or BUOW sign	Cooley, Lee, Singleton

Source: PCR Services Corporation, 2015.

RESULTS

The project site is within the Burrowing Owl Survey Area for the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The following results present the findings of the Step I Habitat Assessment and Step II Locating Burrows and Burrowing Owls.

Step I - Habitat Assessment

Results of the Step I, Habitat Assessment concluded that the project site and 500-foot survey buffer exhibited suitable BUOW habitat consisting of disturbed, low-growing vegetation; bare ground; and fossorial mammal burrows.

PCR

Step II – Locating Burrows and Burrowing Owls

The Step II surveys did not identify BUOW burrows, BUOW sign or BUOW within the project site or within the 500-foot survey buffer. A complete list of all avian species observed within the project site is included in **Appendix A**, *Avian Compendium*, attached.

RECOMMENDATIONS

As required by the MSHCP, a pre-construction survey must be conducted 30 days prior to ground disturbance for project sites whether or not BUOW are found during the focused surveys to avoid the direct take of BUOW.

Should you have any questions concerning the methodology or findings in this report, please contact Ezekiel Cooley (E.Cooley@pcrnet.com) at (949) 753-7001.

Subject: Results of Focused Burrowing Owl Surveys for the Alternative Off-site Waterline Area for the Ironwood Village Project, City of Moreno Valley, Riverside County, California

Dear Mr. Rivani:

This report summarizes the methodology and findings of focused burrowing owl (*Athene cunicularia*) (BUOW) surveys conducted by **ESA PCR** for the two proposed alternative off-site waterline areas associated with the approximately 78.48-acre Ironwood Village Project (APN 473-160-004) located directly northeast of Ironwood Avenue and Nason Street, City of Moreno Valley, Riverside County, California.[1] The surveys encompassed the two alternative off-site waterline areas (survey area) and a 500-foot survey buffer surrounding the survey area (survey buffer). The surveys were conducted in accordance with the County of Riverside's 2006 *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*.[2]

Survey Area Description

The survey area is generally situated south of Interstate 10 (I-10) and north of State Route 60 (SR 60), as shown in **Figure 1**, *Regional Map*. Specifically, the survey area includes a waterline alignment that runs north-south, immediately north of the intersection of Ironwood Avenue and Oliver Street along the Eastern Municipal Water District access road, and another which runs east-west, west of the intersection of Moreno Beach Drive and Juniper Avenue. The survey area and survey buffer are depicted on the U.S. Geological Survey (USGS) 7.5' Sunnymead topographic quadrangle map, Section 34, T. 2 S., R. 3 W., as shown in **Figure 2**, *Vicinity Map*. The topography of the survey area and survey buffer is generally flat with the expectation of fairly steep east-facing slope on the western portion. Elevations in the survey area are approximately 1,858 feet above mean sea level (MSL) along the midpoint of the east-west waterline, to approximately 1,945 feet above MSL at the northern terminus of north-south waterline. Surrounding land uses include residential development to the northeast and east, and undeveloped land to the northwest, west, and south.

Plant Communities

The survey area and survey buffer consists primarily of ruderal and disturbed habitat. Ruderal habitat is dominated by non-native species including mediterranean grass (*Schismus barbatus*), Russian thistle (*Salsola tragus*), and ripgut brome (*Bromus diandrus*). Disturbed areas consist of areas heavily disturbed by human activities, including dirt roads with little to no vegetation.

ESA PCR

Methodology

Step I - Habitat Assessment

The surveys were conducted in accordance with the County of Riverside's 2006 *Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area*.[2] During the Step I Habitat Assessment, suitable habitat was identified on-site during the field survey, including disturbed, low-growing vegetation; bare ground; and small fossorial mammal burrows.

Step II – Locating Burrows and Burrowing Owls

Step II surveys were conducted within the survey area plus an approximately 500-foot survey buffer. Surveys focused on the detection of small fossorial mammal burrows potentially suitable for BUOW, BUOW burrows, individual BUOW, and any diagnostic sign of their occurrence (e.g., molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance). Off-site areas within the 500-foot survey buffer were surveyed by foot where accessible, or with the use of binoculars in areas which were inaccessible.

Surveys were conducted on April 28, May 23, June 9, and July 5, 2016 by ESA PCR biologists Amy Lee and Lauren Singleton. Surveys consisted of four site visits, on four separate days, and were conducted between one hour prior to and two hours after sunrise during suitable weather conditions. Transects were utilized in all accessible areas, spaced no more than 100 feet apart, to allow for 100 percent visibility (**Figure 3**, *Survey Area*, attached). In addition, observations were made with the use of binoculars. Weather conditions consisted of 45 to 100 percent cloud cover with winds between 0 and 4 miles per hour (mph) and air temperatures ranging from 48° to 68° Fahrenheit. Survey data is presented in **Table 1**, *Survey Data*, below.

TABLE 1
SURVEY DATA

Date	Time	Wind (mph) (start/end)	Temperature (F) (start-end)	Weather (start-end)	Results	Surveyor
04/28/16	0600 – 0800	2-4/0-1	50° – 49°	100% Cloud Cover – 100% Cloud Cover	No BUOW or BUOW sign	Singleton
05/23/16	0550 – 0750	0-1/0-1	48° – 54°	90% Cloud Cover – 75% Cloud Cover	No BUOW or BUOW sign	Lee
06/09/16	0525 – 0715	0-1/0-1	61° – 68°	45% Cloud Cover – 45% Cloud Cover	No BUOW or BUOW sign	Lee
07/05/16	0550 – 0735	0-2/0-2	63°– 63°	100% Cloud Cover – 100% Cloud Cover	No BUOW or BUOW sign	Lee

ESA PCR

Results

The survey area is within the Burrowing Owl Survey Area for the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The following results present the findings of the Step I Habitat Assessment and Step II Locating Burrows and Burrowing Owls.

Step I - Habitat Assessment

Results of the Step I, Habitat Assessment concluded that the survey area and 500-foot survey buffer exhibited suitable BUOW habitat consisting of disturbed, low-growing vegetation; bare ground; and fossorial mammal burrows.

Step II – Locating Burrows and Burrowing Owls

The Step II surveys did not identify BUOW burrows, BUOW sign or BUOW within the survey area or within the 500-foot survey buffer. A complete list of all avian species observed within the survey area and survey buffer is included in **Appendix A**, *Avian Compendium*, attached.

Recommendations

As required by the MSHCP, a pre-construction survey must be conducted 30 days prior to ground disturbance for project sites whether or not BUOW are found during the focused surveys to avoid the direct take of BUOW.

Should you have any questions concerning the methodology or findings in this report, please contact Amy Lee (A.Lee@pcrnet.com) at (949) 753-7001.

Sincerely,

Amy Lee

EXECUTIVE SUMMARY

The City of Moreno Valley has not adopted its own thresholds of significance for GHG emissions. As such, a screening threshold of 3,000 MTCO2e per year for residential land uses is applied herein, which is a widely accepted screening threshold accepted by numerous jurisdictions in the South Coast Air Basin and is based on the South Coast Air Quality Management District (SCAQMD) staff's interim GHG screening threshold for stationary source emissions for non-industrial projects, as described in the SCAQMD's *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans* ("SCAQMD Interim GHG Threshold").

The Project will result in approximately 2,905.71 MTCO2e per year; the proposed project would not exceed the SCAQMD threshold of 3,000 MTCO2e per year. Thus, project-related emissions would not have a significant direct or indirect impact on GHG and climate change.

This page intentionally left blank

1 INTRODUCTION

This report presents the results of the greenhouse gas analysis (GHGA) prepared by Urban Crossroads, Inc., for the proposed Ironwood Residential (TTM No. 37001) (referred to as "Project"), which is located north of Ironwood Avenue, east of Nason Street, and west of Oliver Street in the City of Moreno Valley as shown on Exhibit 1-A.

The purpose of this GHGA is to evaluate Project-related construction and operational emissions and determine the level of greenhouse gas (GHG) impacts as a result of constructing and operating the proposed Project.

1.1 PROJECT OVERVIEW

The Project is proposed to consist of 181 single family, detached residential dwelling units as shown on Exhibit 1-B. For the purposes of this GHGA, it is assumed that the Project will be constructed and at full occupancy by 2020.

2 CLIMATE CHANGE SETTING

2.1 INTRODUCTION TO GLOBAL CLIMATE CHANGE

Global Climate Change (GCC) is defined as the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. GCC is currently one of the most controversial environmental issues in the United States, and much debate exists within the scientific community about whether or not GCC is occurring naturally or as a result of human activity. Some data suggests that GCC has occurred in the past over the course of thousands or millions of years. These historical changes to the Earth's climate have occurred naturally without human influence, as in the case of an ice age. However, many scientists believe that the climate shift taking place since the industrial revolution (1900) is occurring at a quicker rate and magnitude than in the past. Scientific evidence suggests that GCC is the result of increased concentrations of greenhouse gases in the earth's atmosphere, including carbon dioxide, methane, nitrous oxide, and fluorinated gases. Many scientists believe that this increased rate of climate change is the result of greenhouse gases resulting from human activity and industrialization over the past 200 years.

An individual project like the proposed Project evaluated in this GHGA cannot generate enough greenhouse gas emissions to effect a discernible change in global climate. However, the proposed Project may participate in the potential for GCC by its incremental contribution of greenhouse gasses combined with the cumulative increase of all other sources of greenhouse gases, which when taken together constitute potential influences on GCC. Because these changes may have serious environmental consequences, Section 3.0 will evaluate the potential for the proposed Project to have a significant effect upon the environment as a result of its potential contribution to the greenhouse effect.

2.2 GREENHOUSE GAS EMISSIONS INVENTORIES

Global

Worldwide anthropogenic (man-made) GHG emissions are tracked by the Intergovernmental Panel on Climate Change for industrialized nations (referred to as Annex I) and developing nations (referred to as Non-Annex I). Man-made GHG emissions data for Annex I nations are available through 2012. For the Year 2011 the sum of these emissions totaled approximately 28,865,994 Gg CO2e[1] (1) (2). The GHG emissions in more recent years may differ from the inventories presented in Table 2-1; however, the data is representative of currently available inventory data.

[1] The global emissions are the sum of Annex I and non-Annex I countries, without counting Land-Use, Land-Use Change and Forestry (LULUCF). For countries without 2005 data, the UNFCCC data for the most recent year were used. United Nations Framework Convention on Climate Change, "Annex I Parties – GHG total without LULUCF,"

United States

As noted in Table 2-1, the United States, as a single country, was the number two producer of GHG emissions in 2012. The primary greenhouse gas emitted by human activities in the United States was CO2, representing approximately 83 percent of total greenhouse gas emissions (3). Carbon dioxide from fossil fuel combustion, the largest source of US greenhouse gas emissions, accounted for approximately 78 percent of the GHG emissions.

TABLE 2-1: TOP GHG PRODUCER COUNTRIES AND THE EUROPEAN UNION[2]

Emitting Countries	GHG Emissions (Gg CO2e)
China	10,975,500
United States	6,665,700
European Union (27 member countries)	4,544,224
Russian Federation	2,322,220
India	3,013,770
Japan	1,344,580
Total	**28,865,994**

State of California

CARB compiles GHG inventories for the State of California. Based upon the 2008 GHG inventory data (i.e., the latest year for which data are available) for the 2000-2008 greenhouse gas emissions inventory, California emitted 474 MMTCO2e including emissions resulting from imported electrical power in 2008 (4). Based on the CARB inventory data and GHG inventories compiled by the World Resources Institute (5), California's total statewide GHG emissions rank second in the United States (Texas is number one) with emissions of 417 MMTCO2e excluding emissions related to imported power.

2.3 GLOBAL CLIMATE CHANGE DEFINED

Global Climate Change (GCC) refers to the change in average meteorological conditions on the earth with respect to temperature, wind patterns, precipitation and storms. Global temperatures are regulated by naturally occurring atmospheric gases such as water vapor, CO2 (Carbon Dioxide), N2O (Nitrous Oxide), CH4 (Methane), hydrofluorocarbons, perfluorocarbons and sulfur hexafluoride. These particular gases are important due to their residence time (duration they stay) in the atmosphere, which ranges from 10 years to more than 100 years. These gases allow solar radiation into the Earth's atmosphere, but prevent radioactive heat from escaping, thus warming the Earth's atmosphere. GCC can occur naturally as it has in the past with the previous ice ages. According to the California Air Resources Board (CARB), the climate change since the industrial revolution differs from previous climate changes in both rate and magnitude (6).

[2] Used http://unfccc.int data for Annex I countries. Consulted the CAIT Climate Data Explorer http://www.eia.gov site to reference Non-Annex I countries such as China and India.

Gases that trap heat in the atmosphere are often referred to as greenhouse gases. Greenhouse gases are released into the atmosphere by both natural and anthropogenic (human) activity. Without the natural greenhouse gas effect, the Earth's average temperature would be approximately 61° Fahrenheit (F) cooler than it is currently. The cumulative accumulation of these gases in the earth's atmosphere is considered to be the cause for the observed increase in the earth's temperature.

Although California's rate of growth of greenhouse gas emissions is slowing, the state is still a substantial contributor to the U.S. emissions inventory total. In 2004, California is estimated to have produced 492 million gross metric tons of carbon dioxide equivalent (CO2e) greenhouse gas emissions. Despite a population increase of 16 percent between 1990 and 2004, California has significantly slowed the rate of growth of greenhouse gas emissions due to the implementation of energy efficiency programs as well as adoption of strict emission controls (5).

2.4 GREENHOUSE GASES

For the purposes of this analysis, emissions of carbon dioxide, methane, and nitrous oxide were evaluated (see Table 3-4 later in this report) because these gasses are the primary contributors to GCC from development projects. Although other substances such as fluorinated gases also contribute to GCC, sources of fluorinated gases are not well-defined and no accepted emissions factors or methodology exist to accurately calculate these gases.

Greenhouse gases have varying global warming potential (GWP) values; GWP values represent the potential of a gas to trap heat in the atmosphere. Carbon dioxide is utilized as the reference gas for GWP, and thus has a GWP of 1.

The atmospheric lifetime and GWP of selected greenhouse gases are summarized at Table 2-2. As shown in the table below, GWP range from 1 for carbon dioxide to 23,900 for sulfur hexafluoride.

TABLE 2-2: GLOBAL WARMING POTENTIAL AND ATMOSPHERIC LIFETIME OF SELECT GHGS

Gas	Atmospheric Lifetime (years)	Global Warming Potential (100 year time horizon)
Carbon Dioxide	50-200	1
Methane	12 ± 3	25
Nitrous Oxide	120	298
HFC-23	264	11,700
HFC-134a	14.6	1,300
HFC-152a	1.5	140
PFC: Tetrafluoromethane (CH4)	50,000	6,500
PFC: Hexafluoroethane (C2F6)	10,000	9,200
Sulfur Hexafluoride (SF6)	3,200	23,900
Source: Environmental Protection Agency (EPA) 2013 (URL: http://www.epa.gov/ghgreporting/documents/pdf/2013/documents/2013-data-elements.pdf)		

Water Vapor: Water vapor (H20) is the most abundant, important, and variable greenhouse gas in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered to be a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. A climate feedback is an indirect, or secondary, change, either positive or negative, that occurs within the climate system in response to a forcing mechanism. The feedback loop in which water is involved is critically important to projecting future climate change.

As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to 'hold' more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop." The extent to which this positive feedback loop will continue is unknown as there are also dynamics that hold the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually also condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the Earth's surface and heat it up).

There are no human health effects from water vapor itself; however, when some pollutants come in contact with water vapor, they can dissolve and the water vapor can then act as a pollutant-carrying agent. The main source of water vapor is evaporation from the oceans (approximately 85 percent). Other sources include: evaporation from other water bodies, sublimation (change from solid to gas) from sea ice and snow, and transpiration from plant leaves.

<u>Carbon Dioxide</u>: Carbon dioxide (CO2) is an odorless and colorless GHG. Outdoor levels of carbon dioxide are not high enough to result in negative health effects. Carbon dioxide is emitted from natural and manmade sources. Natural sources include: the decomposition of dead organic matter; respiration of bacteria, plants, animals and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources include: the burning of coal, oil, natural gas, and wood. Carbon dioxide is naturally removed from the air by photosynthesis, dissolution into ocean water, transfer to soils and ice caps, and chemical weathering of carbonate rocks (7).

Since the industrial revolution began in the mid-1700s, the sort of human activity that increases GHG emissions has increased dramatically in scale and distribution. Data from the past 50 years suggests a corollary increase in levels and concentrations. As an example, prior to the industrial revolution, CO2 concentrations were fairly stable at 280 parts per million (ppm). Today, they are around 370 ppm, an increase of more than 30 percent. Left unchecked, the concentration of carbon dioxide in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources (8).

<u>Methane</u>: Methane (CH4) is an extremely effective absorber of radiation, though its atmospheric concentration is less than carbon dioxide and its lifetime in the atmosphere is brief (10-12 years), compared to other GHGs. No health effects are known to occur from exposure to methane.

Methane has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of methane. Other anthropocentric sources include fossil-fuel combustion and biomass burning.

<u>Nitrous Oxide</u>: Nitrous oxide (N2O), also known as laughing gas, is a colorless greenhouse gas. Nitrous oxide can cause dizziness, euphoria, and sometimes slight hallucinations. In small doses, it is considered harmless. However, in some cases, heavy and extended use can cause Olney's Lesions (brain damage) (9).

Concentrations of nitrous oxide also began to rise at the beginning of the industrial revolution. In 1998, the global concentration was 314 parts per billion (ppb). Nitrous oxide is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant, i.e., in whipped cream bottles. It is also used in potato chip bags to keep chips fresh. It is used in rocket engines and in race cars. Nitrous oxide can be transported into the stratosphere, be deposited on the Earth's surface, and be converted to other compounds by chemical reaction

Chlorofluorocarbons: Chlorofluorocarbons (CFCs) are gases formed synthetically by replacing all hydrogen atoms in methane or ethane (C2H6) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble and chemically unreactive in the troposphere (the level of air at the Earth's surface). CFCs are no longer being used; therefore, it is not likely that health effects would be experienced. Nonetheless, in confined indoor locations, working with CFC-113 or other CFCs is thought to result in death by cardiac arrhythmia (heart frequency too high or too low) or asphyxiation.

CFCs have no natural source, but were first synthesized in 1928. They were used for refrigerants, aerosol propellants and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and was extremely successful, so much so that levels of the major CFCs are now remaining steady or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.

Hydrofluorocarbons: Hydrofluorocarbons (HFCs) are synthetic, man-made chemicals that are used as a substitute for CFCs. Out of all the greenhouse gases, they are one of three groups with the highest global warming potential. The HFCs with the largest measured atmospheric abundances are (in order), HFC-23 (CHF3), HFC-134a (CF3CH2F), and HFC-152a (CH3CHF2). Prior to 1990, the only significant emissions were of HFC-23. HFC-134a emissions are increasing due to its use as a refrigerant. The U.S. EPA estimates that concentrations of HFC-23 and HFC-134a are now about 10 parts per trillion (ppt) each; and that concentrations of HFC-152a are about 1 ppt (10). No health effects are known to result from exposure to HFCs, which are manmade for applications such as automobile air conditioners and refrigerants.

Perfluorocarbons: Perfluorocarbons (PFCs) have stable molecular structures and do not break down through chemical processes in the lower atmosphere. High-energy ultraviolet rays, which occur about 60 kilometers above Earth's surface, are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF4) and hexafluoroethane (C2F6). The U.S. EPA estimates that concentrations of CF4 in the atmosphere are over 70 ppt.

No health effects are known to result from exposure to PFCs. The two main sources of PFCs are primary aluminum production and semiconductor manufacture.

Sulfur Hexafluoride: Sulfur hexafluoride (SF6) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. It also has the highest GWP of any gas evaluated (23,900). The U.S. EPA indicates that concentrations in the 1990s were about 4 ppt. In high concentrations in confined areas, the gas presents the hazard of suffocation because it displaces the oxygen needed for breathing.

Sulfur hexafluoride is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

2.5 EFFECTS OF CLIMATE CHANGE IN CALIFORNIA

Public Health

Higher temperatures may increase the frequency, duration, and intensity of conditions conducive to air pollution formation. For example, days with weather conducive to ozone formation could increase from 25 to 35 percent under the lower warming range to 75 to 85 percent under the medium warming range. In addition, if global background ozone levels increase as predicted in some scenarios, it may become impossible to meet local air quality standards. Air quality could be further compromised by increases in wildfires, which emit fine particulate matter that can travel long distances, depending on wind conditions. The Climate Scenarios report indicates that large wildfires could become up to 55 percent more frequent if GHG emissions are not significantly reduced.

In addition, under the higher warming range scenario, there could be up to 100 more days per year with temperatures above 90oF in Los Angeles and 95oF in Sacramento by 2100. This is a large increase over historical patterns and approximately twice the increase projected if temperatures remain within or below the lower warming range. Rising temperatures could increase the risk of death from dehydration, heat stroke/exhaustion, heart attack, stroke, and respiratory distress caused by extreme heat.

Water Resources

A vast network of man-made reservoirs and aqueducts captures and transports water throughout the state from northern California rivers and the Colorado River. The current distribution system relies on Sierra Nevada snowpack to supply water during the dry spring and summer months. Rising temperatures, potentially compounded by decreases in precipitation, could severely reduce spring snowpack, increasing the risk of summer water shortages.

If temperatures continue to increase, more precipitation could fall as rain instead of snow, and the snow that does fall could melt earlier, reducing the Sierra Nevada spring snowpack by as much as 70 to 90 percent. Under the lower warming range scenario, snowpack losses could be only half as large as those possible if temperatures were to rise to the higher warming range. How much snowpack could be lost depends in part on future precipitation patterns, the projections for which remain uncertain. However, even under the wetter climate projections, the loss of snowpack could pose challenges to water managers and hamper hydropower generation. It could also adversely affect winter tourism. Under the lower warming range, the ski season at lower elevations could be reduced by as much as a month. If temperatures reach the higher warming range and precipitation declines, there might be many years with insufficient snow for skiing and snowboarding.

The State's water supplies are also at risk from rising sea levels. An influx of saltwater could degrade California's estuaries, wetlands, and groundwater aquifers. Saltwater intrusion caused by rising sea levels is a major threat to the quality and reliability of water within the southern edge of the Sacramento/San Joaquin River Delta – a major fresh water supply.

Agriculture

Increased temperatures could cause widespread changes to the agriculture industry reducing the quantity and quality of agricultural products statewide. First, California farmers could possibly lose as much as 25 percent of the water supply they need. Although higher CO_2 levels can stimulate plant production and increase plant water-use efficiency, California's farmers could face greater water demand for crops and a less reliable water supply as temperatures rise. Crop growth and development could change, as could the intensity and frequency of pest and disease outbreaks. Rising temperatures could aggravate O_3 pollution, which makes plants more susceptible to disease and pests and interferes with plant growth.

Plant growth tends to be slow at low temperatures, increasing with rising temperatures up to a threshold. However, faster growth can result in less-than-optimal development for many crops, so rising temperatures could worsen the quantity and quality of yield for a number of California's agricultural products. Products likely to be most affected include wine grapes, fruits and nuts.

In addition, continued global climate change could shift the ranges of existing invasive plants and weeds and alter competition patterns with native plants. Range expansion could occur in many species while range contractions may be less likely in rapidly evolving species with significant populations already established. Should range contractions occur, new or different weed species could fill the emerging gaps. Continued global climate change could alter the abundance and types of many pests, lengthen pests' breeding season, and increase pathogen growth rates.

Forests and Landscapes

Global climate change has the potential to intensify the current threat to forests and landscapes by increasing the risk of wildfire and altering the distribution and character of natural vegetation. If temperatures rise into the medium warming range, the risk of large wildfires in California could increase by as much as 55 percent, which is almost twice the increase expected if temperatures stay in the lower warming range. However, since wildfire risk is determined by a combination of factors, including precipitation, winds, temperature, and landscape and vegetation conditions, future risks will not be uniform throughout the state. In contrast, wildfires in northern California could increase by up to 90 percent due to decreased precipitation.

Moreover, continued global climate change has the potential to alter natural ecosystems and biological diversity within the state. For example, alpine and subalpine ecosystems could decline by as much as 60 to 80 percent by the end of the century as a result of increasing temperatures. The productivity of the state's forests has the potential to decrease as a result of global climate change.

Rising Sea Levels

Rising sea levels, more intense coastal storms, and warmer water temperatures could increasingly threaten the state's coastal regions. Under the higher warming range scenario, sea level is anticipated to rise 22 to 35 inches by 2100. Elevations of this magnitude would inundate low-lying coastal areas with salt water, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. Under the lower warming range scenario, sea level could rise 12-14 inches.

2.6 HUMAN HEALTH EFFECTS

The potential health effects related directly to the emissions of carbon dioxide, methane, and nitrous oxide as they relate to development projects such as the proposed Project are still being debated in the scientific community. Their cumulative effects to global climate change have the potential to cause adverse effects to human health. Increases in Earth's ambient temperatures would result in more intense heat waves, causing more heat-related deaths. Scientists also purport that higher ambient temperatures would increase disease survival rates and result in more widespread disease. Climate change will likely cause shifts in weather patterns, potentially resulting in devastating droughts and food shortages in some areas (11). Exhibit 2-A presents the potential impacts of global warming.

Water Vapor: There are no known direct health effects related to water vapor at this time. It should be noted however that when some pollutants react with water vapor, the reaction forms a transport mechanism for some of these pollutants to enter the human body through water vapor.

Carbon Dioxide: According to the National Institute for Occupational Safety and Health (NIOSH) high concentrations of carbon dioxide can result in health effects such as: headaches, dizziness, restlessness, difficulty breathing, sweating, increased heart rate, increased cardiac output, increased blood pressure, coma, asphyxia, and/or convulsions. It should be noted that current concentrations of carbon dioxide in the earth's atmosphere are estimated to be approximately 370 parts per million (ppm), the actual reference exposure level (level at which adverse health effects typically occur) is at exposure levels of 5,000 ppm averaged over 10 hours in a 40-hour workweek and short-term reference exposure levels of 30,000 ppm averaged over a 15 minute period (12).

Specific health effects associated with directly emitted GHG emissions are as follows:

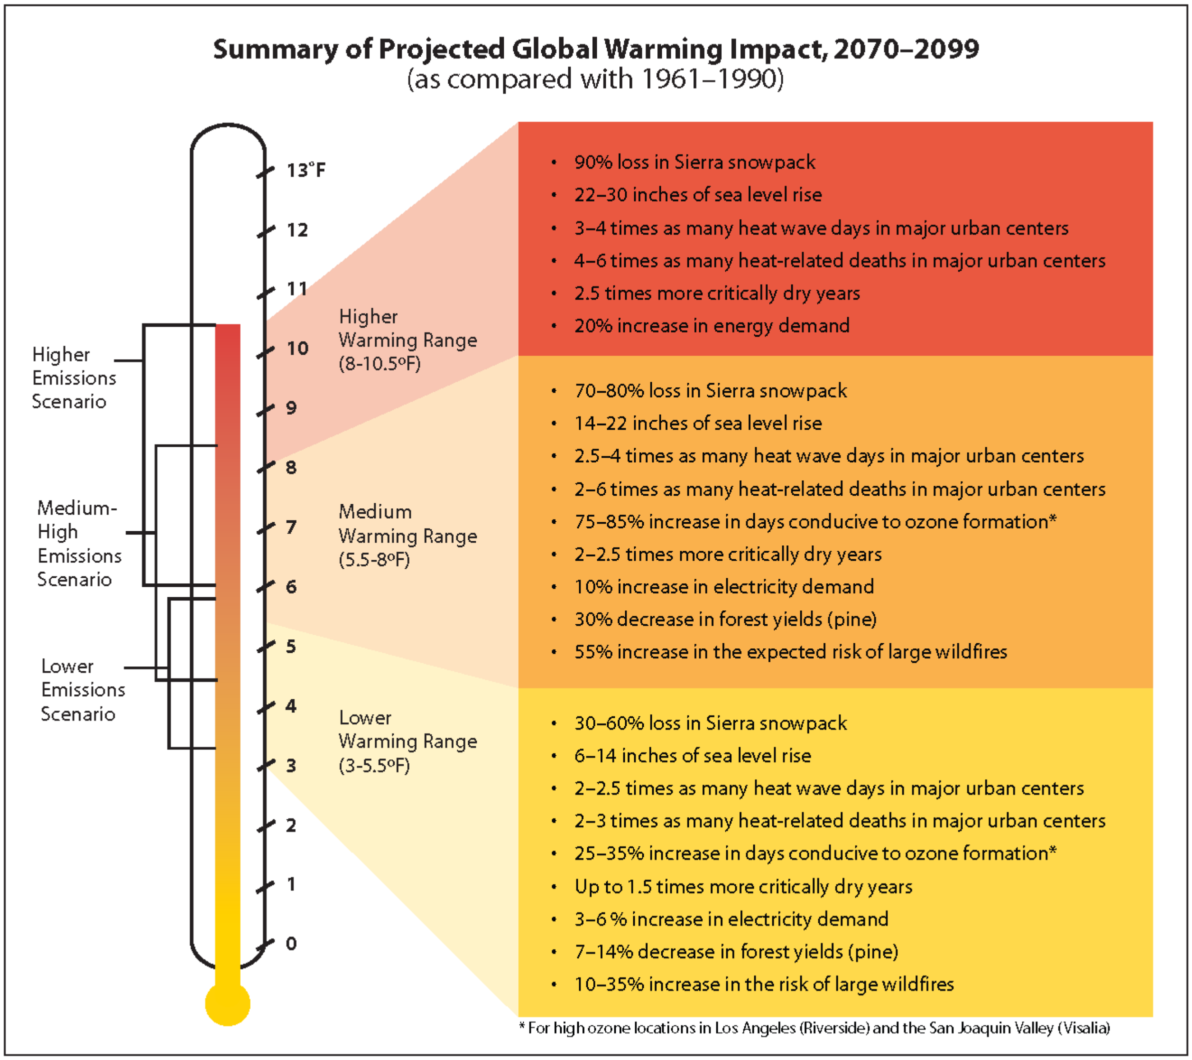
Methane: Methane is extremely reactive with oxidizers, halogens, and other halogen-containing compounds. Methane is also an asphyxiant and may displace oxygen in an enclosed space (13).

Nitrous Oxide: Nitrous Oxide is often referred to as laughing gas; it is a colorless greenhouse gas. The health effects associated with exposure to elevated concentrations of nitrous oxide include dizziness, euphoria, slight hallucinations, and in extreme cases of elevated concentrations nitrous oxide can also cause brain damage (13).

Fluorinated Gases: High concentrations of fluorinated gases can also result in adverse health effects such as asphyxiation, dizziness, headache, cardiovascular disease, cardiac disorders, and in extreme cases, increased mortality (12).

Aerosols: The health effects of aerosols are similar to that of other fine particulate matter. Thus aerosols can cause elevated respiratory and cardiovascular diseases as well as increased mortality (14).

EXHIBIT 2-A: SUMMARY OF PROJECTED GLOBAL WARMING IMPACT



2.7 REGULATORY SETTING

International Regulation and the Kyoto Protocol:

In 1988, the United Nations established the Intergovernmental Panel on Climate Change to evaluate the impacts of global warming and to develop strategies that nations could implement to curtail global climate change. In 1992, the United States joined other countries around the world in signing the United Nations' Framework Convention on Climate Change (UNFCCC) agreement with the goal of controlling greenhouse gas emissions. As a result, the Climate

Change Action Plan was developed to address the reduction of GHGs in the United States. The Plan currently consists of more than 50 voluntary programs for member nations to adopt.

The Kyoto protocol is a treaty made under the UNFCCC and was the first international agreement to regulate GHG emissions. Some have estimated that if the commitments outlined in the Kyoto protocol are met, global GHG emissions could be reduced an estimated five percent from 1990 levels during the first commitment period of 2008-2012. Notably, while the United States is a signatory to the Kyoto protocol, Congress has not ratified the Protocol and the United States is not bound by the Protocol's commitments. In December 2009, international leaders from 192 nations met in Copenhagen to address the future of international climate change commitments post-Kyoto.

Federal Regulation and the Clean Air Act:

Coinciding 2009 meeting in Copenhagen, on December 7, 2009, the U.S. Environmental Protection Agency (EPA) issued an Endangerment Finding under Section 202(a) of the Clean Air Act, opening the door to federal regulation of GHGs. The Endangerment Finding notes that GHGs threaten public health and welfare and are subject to regulation under the Clean Air Act. To date, the EPA has not promulgated regulations on GHG emissions, but it has already begun to develop them.

Previously the EPA had not regulated GHGs under the Clean Air Act (15) because it asserted that the Act did not authorize it to issue mandatory regulations to address global climate change and that such regulation would be unwise without an unequivocally established causal link between GHGs and the increase in global surface air temperatures. In Massachusetts v. Environmental Protection Agency et al. (127 S. Ct. 1438 (2007), however, the U.S. Supreme Court held that GHGs are pollutants under the Clean Air Act and directed the EPA to decide whether the gases endangered public health or welfare. The EPA had also not moved aggressively to regulate GHGs because it expected Congress to make progress on GHG legislation, primarily from the standpoint of a cap-and-trade system. However, proposals circulated in both the House of Representative and Senate have been controversial and it may be some time before the U.S. Congress adopts major climate change legislation. The EPA's Endangerment Finding paves the way for federal regulation of GHGs with or without Congress.

Although global climate change did not become an international concern until the 1980s, efforts to reduce energy consumption began in California in response to the oil crisis in the 1970s, resulting in the unintended reduction of greenhouse gas emissions. In order to manage the state's energy needs and promote energy efficiency, AB 1575 created the California Energy Commission (CEC) in 1975.

Title 24 Energy Standards:

The California Energy Commission (CEC) first adopted Energy Efficiency Standards for Residential and Nonresidential Buildings (16) in 1978 in response to a legislative mandate to reduce energy consumption in the state. Although not originally intended to reduce GHG emissions, increased energy efficiency, and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. The standards are updated periodically to allow for the consideration and inclusion of new energy efficiency technologies and methods. The Energy Commission's most recent standard, 2013 Building Energy Efficiency Standard, is 25 percent more efficient than previous standards for residential construction and 30 percent better for nonresidential construction. The Standards, which took effect on January 1, 2014, offer builders better windows, insulation, lighting, ventilation systems and other features that reduce energy consumption in homes and businesses. Some improved measures in the Standards include:

Residential:

- Solar-ready roofs to allow homeowners to add solar photovoltaic panels at a future date
- More efficient windows to allow increased sunlight, while decreasing heat gain
- Insulated hot water pipes, to save water and energy and reduce the time it takes to deliver hot water
- Whole house fans to cool homes and attics with evening air reducing the need for air conditioning load
- Air conditioner installation verification to insure efficient operation

Nonresidential:

- High performance windows, sensors and controls that allow buildings to use "daylighting"
- Efficient process equipment in supermarkets, computer data centers, commercial kitchens, laboratories, and parking garages
- Advanced lighting controls to synchronize light levels with daylight and building occupancy, and provide demand response capability
- Solar-ready roofs to allow businesses to add solar photovoltaic panels at a future date
- Cool roof technologies

<u>CALGreen</u>

Part 11 of the Title 24 Building Standards Code is referred to as the California Green Building Standards Code (CALGreen Code) (17). The purpose of the CALGreen Code is to “improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices in the following categories: (1) Planning and design; (2) Energy efficiency; (3) Water efficiency and conservation; (4) Material conservation and resource efficiency; and (5) Environmental air quality.” The CALGreen Code is not intended to substitute or be identified as meeting the certification requirements of any green building program that is not established and adopted by the California Building Standards Commission (CBSC). The CBSC has released the 2010 California Green Building Standards Code on its Web site. Unless otherwise noted in the regulation, all newly constructed buildings in California are subject of the requirements of the CALGreen Code.

CALGreen contains both mandatory and voluntary measures, for Non-Residential land uses there are 39 mandatory measures including, but not limited to: exterior light pollution reduction, wastewater reduction by 20%, and commissioning of projects over 10,000 sf. There are two tiers of voluntary measures for Non-Residential land uses for a total of 36 additional elective measures.

The 2013 CALGreen includes additions and amendments to the water efficiency standards for non residential buildings in order to comply with the reduced flow rate table. The 2013 CALGreen has also been rewritten to clarify and definitively identify the requirements and applicability for residential and nonresidential buildings.

California Assembly Bill No. 1493 (AB 1493):

AB 1493 requires CARB to develop and adopt the nation's first greenhouse gas emission standards for automobiles. The Legislature declared in AB 1493 that global warming was a matter of increasing concern for public health and environment in California (18). Further, the legislature stated that technological solutions to reduce greenhouse gas emissions would stimulate the California economy and provide jobs.

To meet the requirements of AB 1493, ARB approved amendments to the California Code of Regulations (CCR) adding GHG emission standards to California's existing motor vehicle emission standards in 2004. Amendments to CCR Title 13 Sections 1900 (CCR 13 1900) and 1961 (CCR 13 1961) and adoption of Section 1961.1 (CCR 13 1961.1) require automobile manufacturers to meet fleet average GHG emission limits for all passenger cars, light-duty trucks within various weight criteria, and medium-duty passenger vehicle weight classes beginning with the 2009 model year. Emission limits are further reduced each model year through 2016.

In December 2004 a group of car dealerships, automobile manufacturers, and trade groups representing automobile manufacturers filed suit against ARB to prevent enforcement of CCR 13 1900 and CCR 13 1961 as amended by AB 1493 and CCR 13 1961.1 (Central Valley Chrysler-Jeep et al. v. Catherine E. Witherspoon, in her official capacity as Executive Director of the California Air Resources Board, et al.). The suit, heard in the U.S. District Court for the Eastern District of California, contended that California's implementation of regulations that in effect regulate vehicle fuel economy violates various federal laws, regulations, and policies. In January 2007, the judge hearing the case accepted a request from the State Attorney General's office that the trial be postponed until a decision is reached by the U.S. Supreme Court on a separate case addressing GHGs. In the Supreme Court Case, Massachusetts vs. EPA, the primary issue in question is whether the federal CAA provides authority for USEPA to regulate CO2 emissions. In April 2007, the U.S. Supreme Court ruled in Massachusetts' favor, holding that GHGs are air pollutants under the CAA. On December 11, 2007, the judge in the Central Valley Chrysler-Jeep case rejected each plaintiff's arguments and ruled in California's favor. On December 19, 2007, the USEPA denied California's waiver request. California filed a petition with the Ninth Circuit Court of Appeals challenging USEPA's denial on January 2, 2008.

The Obama administration subsequently directed the USEPA to re-examine their decision. On May 19, 2009, challenging parties, automakers, the State of California, and the federal government reached an agreement on a series of actions that would resolve these current and potential future disputes over the standards through model year 2016. In summary, the USEPA and the U.S. Department of Transportation agreed to adopt a federal program to reduce GHGs and improve fuel economy, respectively, from passenger vehicles in order to achieve equivalent or greater greenhouse gas benefits as the AB 1493 regulations for the 2012–2016 model years. Manufacturers agreed to ultimately drop current and forego similar future legal challenges, including challenging a waiver grant, which occurred on June 30, 2009. The State of California committed to (1) revise its standards to allow manufacturers to demonstrate compliance with the fleet-average GHG emission standard by "pooling" California and specified State vehicle sales; (2) revise its standards for 2012–2016 model year vehicles so that compliance with USEPA-adopted GHG standards would also comply with California's standards; and (3) revise its standards, as necessary, to allow manufacturers to use emissions data from the federal CAFE program to demonstrate compliance with the AB 1493 regulations (CARB 2009, http://www.arb.ca.gov/regact/2009/ghgpv09/ghgpvisor.pdf) both of these programs are aimed at light-duty auto and light-duty trucks.

<u>Executive Order S-3-05:</u>

Executive Order S-3-05, which was signed by Governor Schwarzenegger in 2005, proclaims that California is vulnerable to the impacts of climate change (19). It declares that increased temperatures could reduce the Sierra's snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea levels. To combat those concerns, the Executive Order established total greenhouse gas emission targets. Specifically, emissions are to be reduced to the 1990 level by 2020, and to 80% below the 1990 level by 2050. The Executive Order directed the Secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce greenhouse gas emissions to the target levels. The Secretary also is required to submit biannual reports to the Governor and state Legislature describing: (1) progress made toward reaching the emission targets; (2) impacts of global warming on California's resources; and (3) mitigation and adaptation plans to combat these impacts. To comply with the Executive Order, the Secretary of the CalEPA created a Climate Action Team (CAT) made up of members from various state agencies and commission. CAT released its first report in March 2006. The report proposed to achieve the targets by building on voluntary actions of California businesses, local government and community actions, as well as through state incentive and regulatory programs.

<u>California Assembly Bill 32 (AB 32):</u>

In September 2006, Governor Arnold Schwarzenegger signed AB 32, the California Climate Solutions Act of 2006. AB 32 requires that statewide GHG emissions be reduced to 1990 levels by the year 2020 (20). This reduction will be accomplished through an enforceable statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs CARB to develop and implement regulations to reduce statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then CARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires that CARB adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrives at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the state achieves reductions in GHG emissions necessary to meet the cap. AB 32 also includes guidance to institute emissions reductions in an economically efficient manner and conditions to ensure that businesses and consumers are not unfairly affected by the reductions.

In November 2007, CARB completed its estimates of 1990 GHG levels. Net emission 1990 levels were estimated at 427 MMTs (emission sources by sector were: transportation – 35 percent; electricity generation – 26 percent; industrial – 24 percent; residential – 7 percent; agriculture – 5 percent; and commercial – 3 percent). Accordingly, 427 MMTs of CO2 equivalent was established as the emissions limit for 2020. For comparison, CARB's estimate for baseline GHG emissions was 473 MMT for 2000 and 532 MMT for 2010. "Business as usual" conditions (without the 28.4 percent reduction to be implemented by CARB regulations) for 2020 were projected to be 596 MMTs.

In December 2007, CARB approved a regulation for mandatory reporting and verification of GHG emissions for major sources. This regulation covered major stationary sources such as cement plants, oil refineries, electric generating facilities/providers, and co-generation facilities, which comprise 94 percent of the point source CO2 emissions in the State.

On December 11, 2008, CARB adopted a scoping plan to reduce GHG emissions to 1990 levels. The Scoping Plan's recommendations for reducing GHG emissions to 1990 levels by 2020 include emission reduction measures, including a cap-and-trade program linked to Western Climate Initiative partner jurisdictions, green building strategies, recycling and waste-related measures, as well as Voluntary Early Actions and Reductions. Implementation of individual measures must begin no later than January 1, 2012, so that the emissions reduction target can be fully achieved by 2020.

Table 2-3 shows the proposed reductions from regulations and programs outlined in the Scoping Plan. While local government operations were not accounted for in achieving the 2020 emissions reduction, local land use changes are estimated to result in a reduction of 5 MMTons of CO2e, which is approximately 3 percent of the 2020 GHG emissions reduction goal. In recognition of the critical role local governments will play in successful implementation of AB 32, CARB is recommending GHG reduction goals of 15 percent of 2006 levels by 2020 to ensure that municipal and community-wide emissions match the state's reduction target. According to the Measure Documentation Supplement to the Scoping Plan, local government actions and targets are anticipated to reduce vehicle miles by approximately 2 percent through land use planning, resulting in a potential GHG reduction of 2 MMTons tons of CO2e (or approximately 1.2 percent of the GHG reduction target).

Overall, CARB determined that achieving the 1990 emission level in 2020 would require a reduction in GHG emissions of approximately 28.5 percent in the absence of new laws and regulations (referred to as "Business-As-Usual" [BAU]). The Scoping Plan evaluates opportunities for sector-specific reductions, integrates all CARB and California Climate Action

TABLE 2-3: SCOPING PLAN GHG REDUCTION MEASURES TOWARDS 2020 TARGET

Recommended Reduction Measures	Reductions Counted toward 2020 Target of 169 MMT CO2e	Percentage of Statewide 2020 Target
Cap and Trade Program and Associated Measures		
California Light-Duty Vehicle GHG Standards	31.7	19%
Energy Efficiency	26.3	16%
Renewable Portfolio Standard (33 percent by 2020)	21.3	13%
Low Carbon Fuel Standard	15	9%
Regional Transportation-Related GHG Targets[1]	5	3%
Vehicle Efficiency Measures	4.5	3%
Goods Movement	3.7	2%
Million Solar Roofs	2.1	1%
Medium/Heavy Duty Vehicles	1.4	1%
High Speed Rail	1.0	1%
Industrial Measures	0.3	0%
Additional Reduction Necessary to Achieve Cap	34.4	20%
Total Cap and Trade Program Reductions	146.7	87%
Uncapped Sources/Sectors Measures		
High Global Warming Potential Gas Measures	20.2	12%
Sustainable Forests	5	3%
Industrial Measures (for sources not covered under cap and trade program)	1.1	1%
Recycling and Waste (landfill methane capture)	1	1%
Total Uncapped Sources/Sectors Reductions	27.3	16%
Total Reductions Counted toward 2020 Target	174	100%
Other Recommended Measures – Not Counted toward 2020 Target		
State Government Operations	1.0 to 2.0	1%
Local Government Operations	To Be Determined[2]	NA
Green Buildings	26	15%
Recycling and Waste	9	5%
Water Sector Measures	4.8	3%
Methane Capture at Large Dairies	1	1%
Total Other Recommended Measures – Not Counted toward 2020 Target	42.8	NA

Source: CARB. 2008, MMTons CO2e: million metric tons of CO2e

[1]Reductions represent an estimate of what may be achieved from local land use changes. It is not the SB 375 regional target.

[2]According to the Measure Documentation Supplement to the Scoping Plan, local government actions and targets are anticipated to reduce vehicle miles by approximately 2 percent through land use planning, resulting in a potential GHG reduction of 2 million metric tons of CO2e (or approximately 1.2 percent of the GHG reduction target). However, these reductions were not included in the Scoping Plan reductions to achieve the 2020 Target

Team early actions and additional GHG reduction measures, identifies additional measures to be pursued as regulations, and outlines the role of the cap-and-trade program.

In connection with its preparation of the August 2011 Final Supplement to the Scoping Plan's Functional Equivalent Document, CARB released revised estimates of the 2020 emissions level projection in light of the economic recession and the availability of updated information from development of measure-specific regulations. Based on the new economic data, CARB determined the 2020 emissions level projection in the BAU condition would be reduced from 596 metric tons of CO2 equivalent (MTCO2e) to 545 MTCO2e. (21) Under this scenario, achieving the 1990 emissions level in 2020 would require a reduction of GHG emissions of 118 MTCO2e, or 21.7 percent (down from 28.5 percent), from the BAU condition.

When the 2020 emissions level projection also was updated to account for implemented regulatory measures, including Pavley (vehicle model-years 2009 - 2016) and the renewable portfolio standard (12% - 20%), the 2020 projection in the BAU condition was reduced further to 507 MTCO2e. As a result, based on the updated economic and regulatory data, CARB determined that achieving the 1990 emissions level in 2020 would now only require a reduction of GHG emissions of 80 MTCO2e, or approximately 16 percent (down from 28.5 percent), from the BAU condition. (21) (22)

On February 10, 2014, CARB released a Draft Proposed First Update of the Scoping Plan. The draft recalculates 1990 GHG emissions using new global warming potentials identified in the IPCC Fourth Assessment Report released in 2007. Using those GWPs, the 427 MTCO2e 1990 emissions level and 2020 GHG emissions limit identified in the 2008 Scoping Plan would be slightly higher, at 431 MTCO2e. (23) Based on the revised 2020 emissions level projection identified in the 2011 Final Supplement and the updated 1990 emissions levels identified in the discussion draft of the First Update, achieving the 1990 emissions level in 2020 would require a reduction of 78 MTCO2e (down from 509 MTCO2e), or approximately 15.3 percent (down from 28.5 percent), from the BAU condition. (21) (22) (23)

Although CARB has released an update to the Scoping Plan and reduction targets from BAU, it is still appropriate to utilize the previous 28.5% reduction from BAU since the modeling tools available are not able to easily segregate the inclusion of the renewable portfolio standards, and Pavley requirements that are now included in the revised BAU scenario.

<u>California Senate Bill No. 1368 (SB 1368):</u>

In 2006, the State Legislature adopted Senate Bill 1368 ("SB 1368"), which was subsequently signed into law by the Governor (24). SB 1368 directs the California Public Utilities Commission ("CPUC") to adopt a greenhouse gas emission performance standard ("EPS") for the future power purchases of California utilities. SB 1368 seeks to limit carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than five years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. Due to the carbon content of its fuel source, a coal-fired plant cannot meet this standard because such plants emit roughly twice as much carbon as natural gas, combined cycle plants.

Accordingly, the new law will effectively prevent California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. Thus, SB 1368 will lead to dramatically lower greenhouse gas emissions associated with California energy demand, as SB 1368 will effectively prohibit California utilities from purchasing power from out of state producers that cannot satisfy the EPS standard required by SB 1368.

<u>Senate Bill 97 (SB 97):</u>

Pursuant to the direction of SB 97, OPR released preliminary draft CEQA Guideline amendments for greenhouse gas emissions on January 8, 2009, and submitted its final proposed guidelines to the Secretary for Natural Resources on April 13, 2009 (25). The Natural Resources Agency adopted the Guideline amendments and they became effective on March 18, 2010.

Of note, the new guidelines state that a lead agency shall have discretion to determine whether to use a quantitative model or methodology, or in the alternative, rely on a qualitative analysis or performance based standards. CEQA Guideline § 15064.4(a)"A lead agency shall have discretion to determine, in the context of a particular project, whether to: (1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use . . .; or (2) Rely on a qualitative analysis or performance based standards."

Also amended were CEQA Guidelines Sections 15126.4 and 15130, which address mitigation measures and cumulative impacts respectively. Greenhouse gas mitigation measures are referenced in general terms, but no specific measures are championed. The revision to the cumulative impact discussion requirement (Section 15130) simply directs agencies to analyze greenhouse gas emissions in an EIR when a Project's incremental contribution of emissions may be cumulatively considerable, however it does not answer the question of when emission are cumulatively considerable.

Section 15183.5 permits programmatic greenhouse gas analysis and later project-specific tiering, as well as the preparation of Greenhouse Gas Reduction Plans. Compliance with such plans can support determination that a Project's cumulative effect is not cumulatively considerable, according to proposed Section 15183.5(b).

CEQA emphasizes that the effects of greenhouse gas emissions are cumulative, and should be analyzed in the context of CEQA's requirements for cumulative impacts analysis. (See CEQA Guidelines Section 15130(f)).

Section 15064.4(b) of the CEQA Guidelines provides direction for lead agencies for assessing the significance of impacts of greenhouse gas emissions:

1. The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; or

3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such regulations or requirements must be adopted by the relevant public agency through a public review process and must include specific requirements that reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

The CEQA Guideline amendments do not identify a threshold of significance for greenhouse gas emissions, nor do they prescribe assessment methodologies or specific mitigation measures. Instead, they call for a "good-faith effort, based on available information, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project." The amendments encourage lead agencies to consider many factors in performing a CEQA analysis and preserve lead agencies' discretion to make their own determinations based upon substantial evidence. The amendments also encourage public agencies to make use of programmatic mitigation plans and programs from which to tier when they perform individual project analyses. Specific GHG language incorporated in the Guidelines' suggested Environmental Checklist (Guidelines Appendix G) is as follows:

VII. GREENHOUSE GAS EMISSIONS

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

<u>Executive Order S-01-07:</u>

On January 18, 2007 California Governor Arnold Schwarzenegger, through Executive Order S-01-07, mandated a statewide goal to reduce the carbon intensity of California's transportation fuel by at least ten percent by 2020 (26). The order also requires that a California specific Low Carbon Fuel Standard be established for transportation fuels.

<u>Executive Order B-30-15:</u>

On April 29, 2015 California Governor Jerry Brown, through Executive Order B-30-15 ("BEO") states a new statewide policy goal to reduce GHG emissions 40 percent below their 1990 levels by 2030. It should be noted that the BEO was issued after the notice of preparation date for the Project of April 1, 2015.

The BEO sets an ambitious new Statewide GHG emissions reduction target of 40% below 1990 levels by 2030 as a "mid-term" benchmark needed to achieve the 80% below 1990 levels by 2050. It should be noted however that this target has not been formally enacted by the Legislature or even CARB. As such, the BEO does not appear to constitute a new regulation or requirement adopted to implement a statewide, regional or local plan for the reduction of GHG emissions within the context of CEQA.

The Project reduces its GHG emissions to the maximum extent feasible as discussed in this document. At this time, no further analysis is necessary or required by CEQA as it pertains to Executive Order B-30-15.

Senate Bills 1078 and 107 and Executive Order S-14-08:

SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20% of their supply from renewable sources by 2017 (27). SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010 (26). In November 2008 Governor Schwarzenegger signed Executive Order S-14-08, which expands the state's Renewable Energy Standard to 33% renewable power by 2020 (28).

Senate Bill 375:

SB 375, signed in September 2008 (Chapter 728, Statutes of 2008), aligns regional transportation planning efforts, regional GHG reduction targets, and land use and housing allocation (29). SB 375 requires metropolitan planning organizations (MPOs) to adopt a sustainable communities strategy (SCS) or alternative planning strategy (APS) that will prescribe land use allocation in that MPO's regional transportation plan. ARB, in consultation with MPOs, will provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035.

These reduction targets will be updated every 8 years but can be updated every 4 years if advancements in emissions technologies affect the reduction strategies to achieve the targets. ARB is also charged with reviewing each MPO's SCS or APS for consistency with its assigned targets. If MPOs do not meet the GHG reduction targets, transportation projects will not be eligible for funding programmed after January 1, 2012.

This law also extends the minimum time period for the regional housing needs allocation cycle from 5 years to 8 years for local governments located within an MPO that meets certain requirements. City or county land use policies (including general plans) are not required to be consistent with the regional transportation plan (and associated SCS or APS). However, new provisions of CEQA would incentivize (through streamlining and other provisions) qualified projects that are consistent with an approved SCS or APS, categorized as "transit priority projects."

The Southern California Association of Governments (SCAG) is required by law to update the Southern California Regional Transportation Plan (RTP) every four years. The 2012 draft plan has been released, this draft plan differs from past plans because it includes development of a SCS. The RTP/SCS incorporates land use and housing policies to meet the greenhouse gas emissions targets established by the California Air Resource Board (CARB) for 2020 (8% reduction) and 2035 (13% reduction). On April 4, 2012, the Regional Council of the Southern

California Association of Governments (SCAG) adopted the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS): Towards a Sustainable Future.

<u>CARB's Preliminary Draft Staff Proposal for Interim Significance Thresholds:</u>

Separate from its Scoping Plan approved in December of 2008 (30), CARB issued a Staff Proposal in October 2008, as its first step toward developing recommended statewide interim thresholds of significance for GHGs that may be adopted by local agencies for their own use. CARB staff's objective in this proposal is to develop a threshold of significance that will result in the vast majority (approximately 90 percent statewide) of GHG emissions from new industrial projects being subject to CEQA's requirement to impose feasible mitigation. The proposal does not attempt to address every type of project that may be subject to CEQA, but instead focuses on common project types that, collectively, are responsible for substantial GHG emissions – specifically, industrial, residential, and commercial projects. CARB is developing these thresholds in these sectors to advance climate objectives, streamline project review, and encourage consistency and uniformity in the CEQA analysis of GHG emissions throughout the state. These draft thresholds are under revision in response to comments. There is currently no timetable for finalized thresholds at this time.

As currently proposed by CARB, a quantitative threshold of 7,000 metric tons (MT) of CO2e per year for operational emissions (excluding transportation), and performance standards yet to be defined for construction and transportation emissions are under consideration. However, CARB's proposal is not yet final, and thus cannot be applied to the Project.

<u>South Coast Air Quality Management District Recommendations for Significance Thresholds:</u>

In April 2008, the South Coast Air Quality Management District (SCAQMD), in order to provide guidance to local lead agencies on determining the significance of GHG emissions identified in CEQA documents, convened a "GHG CEQA Significance Threshold Working Group." The goal of the working group is to develop and reach consensus on an acceptable CEQA significance threshold for GHG emissions that would be utilized on an interim basis until CARB (or some other state agency) develops statewide guidance on assessing the significance of GHG emissions under CEQA.

Initially, SCAQMD staff presented the working group with a significance threshold that could be applied to various types of projects—residential; non-residential; industrial; etc (31). However, the threshold is still under development. In December 2008, staff presented the SCAQMD Governing Board with a significance threshold for stationary source projects where it is the lead agency. This threshold uses a tiered approach to determine a project's significance, with 10,000 metric tons of carbon dioxide equivalent (MTCO2e) as a screening numerical threshold for stationary sources. More importantly it should be noted that when setting the 10,000 MTCO2e threshold, the SCAQMD did not consider mobile sources (vehicular travel), rather the threshold is based mainly on stationary source generators such as boilers, refineries, power plants, etc. Therefore it would be misleading to apply a threshold that was developed without consideration for mobile sources to a Project where the majority of emissions are related to mobile sources. Thus there is no SCAQMD threshold that can be applied to this Project.

In September 2010 (32), the Working Group released additional revisions that consist of the following recommended tiered approach:

- Tier 1 consists of evaluating whether or not the Project qualifies for applicable CEQA exemptions.
- Tier 2 consists of determining whether or not a Project is consistent with a greenhouse gas reduction plan. If a Project is consistent with a greenhouse gas reduction plan, it would not have a significant impact.
- Tier 3 consists of screening values at the discretion of the lead agency; however they should be consistent for all projects within its jurisdiction. Project-related construction emissions should be amortized over 30 years and should be added back the Project's operational emissions. The following thresholds are proposed for consideration:
    - 3,000 MTCO2e per year for all land use types

      or
    - 3,500 MTCO2e per year for residential; 1,400 MTCO2e per year for commercial; or 3,000 MTCO2e per year for mixed-use projects
- Tier 4 has the following options:
    - Option 1: Reduce emissions from business as usual by a certain percentage (currently undefined)
    - Option 2: Early implementation of applicable AB 32 Scoping Plan measures
    - Option 3: A project-level efficiency target of 4.8 MTCO2e per service population as a 2020 target and 3.0 MTCO2e per service population as a 2035 target. The recommended plan-level target for 2020 is 6.6 MTCO2e and the plan level target for 2035 is 4.1 MTCO2e
- Tier 5 involves mitigation offsets to achieve target significance thresholds

The SCAQMD has also adopted Rules 2700, 2701, and 2702 that address GHG reductions. However, these rules address boilers and process heater, forestry, and manure management projects, none of which are required by the Project

2.8 DISCUSSION ON ESTABLISHMENT OF SIGNIFICANCE THRESHOLDS

The City of Moreno Valley has not adopted a threshold of significance for GHG emissions. As such, a screening threshold of 3,000 MTCO2e per year for residential land uses is applied herein, which is a widely accepted screening threshold used by the County of Riverside and numerous jurisdictions in the South Coast Air Basin and is based on the South Coast Air Quality Management District (SCAQMD) staff's proposed GHG screening threshold for stationary source emissions for non-industrial projects, as described in the SCAQMD's *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans* ("SCAQMD Interim GHG Threshold"). The SCAQMD Interim GHG Threshold identifies a screening threshold to determine whether additional analysis is required (33). As noted by the SCAQMD:

> "…the…screening level for stationary sources is based on an emission capture rate of 90 percent for all new or modified projects...the policy objective of [SCAQMD's]

recommended interim GHG significance threshold proposal is to achieve an emission capture rate of 90 percent of all new or modified stationary source projects. A GHG significance threshold based on a 90 percent emission capture rate may be more appropriate to address the long-term adverse impacts associated with global climate change because most projects will be required to implement GHG reduction measures. Further, a 90 percent emission capture rate sets the emission threshold low enough to capture a substantial fraction of future stationary source projects that will be constructed to accommodate future statewide population and economic growth, while setting the emission threshold high enough to exclude small projects that will in aggregate contribute a relatively small fraction of the cumulative statewide GHG emissions. This assertion is based on the fact that [SCAQMD] staff estimates that these GHG emissions would account for slightly less than one percent of future 2050 statewide GHG emissions target (85 [MMTCO2e/yr]). In addition, these small projects may be subject to future applicable GHG control regulations that would further reduce their overall future contribution to the statewide GHG inventory. Finally, these small sources are already subject to [Best Available Control Technology] (BACT) for criteria pollutants and are more likely to be single-permit facilities, so they are more likely to have few opportunities readily available to reduce GHG emissions from other parts of their facility." (33)

Thus, and based on guidance from the SCAQMD, if a residential project would emit GHGs less than 3,000 $MTCO_2e$ per year, the project is not considered a substantial GHG emitter and the GHG impact is less than significant, requiring no additional analysis and no mitigation. On the other hand, if a residential project would emit GHGs in excess of 3,000 MTCO2e per year, then the project could be considered a substantial GHG emitter, requiring additional analysis and potential mitigation.

2.9 CITY OF MORENO VALLEY GENERAL PLAN MEASURES

Although the City of Moreno Valley General Plan does not identify specific GHG or climate change policies or goal, a number of the measures identified in the General Plan's Air Quality Element act to reduce or control criteria pollutant emissions and peripherally reduce GHG emissions. The proposed Project has been evaluated for consistency with the City's General Plan Air Quality Element, as shown on Table 2-4.

TABLE 2-4: CITY OF MORENO VALLEY GENERAL PLAN CONSISTENCY

Objective 6.6: Promote land use patterns that reduce daily automotive trips and reduce trip distance for work, shopping, school, and recreation.	**Consistent.** *The Project site is developed approximately 0.50 miles north of a regional shopping center (Stoneridge Towne Centre)*
Objective 6.7: Reduce mobile and stationary source air pollutant emissions.	**Consistent.** *The Project site is located proximate to existing and proposed major roadways, acting to generally reduce vehicle trip lengths, thereby reducing mobile source emissions.*
Policy 6.7.5: Require grading activities to comply with South Coast Air Quality Management District's Rule 403 regarding the control of fugitive dust.	**Consistent.** *The Project will be required to implement fugitive dust control measures consistent with SCAQMD Rule 403.*

Policy 6.7.6: Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code [California Code of Regulations].	**Consistent.** *Pursuant to City and State Building Code requirements, the Project will meet or surpass applicable CCR Title 24 energy conservation requirements.*

2.10 CITY OF MORENO VALLEY ENERGY EFFICIENCY AND CLIMATE ACTION STRATEGY

The City of Moreno Valley released an Energy Efficiency and Climate Action Strategy (CAS) as well as a Greenhouse Gas Analysis for public review on May 8, 2012. The documents were approved on October 9, 2012. The CAS identifies ways that the City can reduce energy and water consumption and greenhouse gas emissions as an organization (its employees and the operation of its facilities) and outlines the actions that the City can encourage and community members can employ to reduce their own energy and water consumption and greenhouse gas emissions. The policies in the document are to reduce greenhouse gas emissions in 2010 by 15 percent by 2020. The following consists of an analysis of project consistency with the policies in the CAS.

- R2-T1: Land Use Based Trips and VMT Reduction Policies. Encourage the development of Transit Priority Projects along High Quality Transit Corridors identified in the SCAG Sustainable Communities Plan, to allow a reduction in vehicle miles traveled.

  Project consistency: Not applicable.
- R2-T3: Employment-Based Trip Reductions. Require a Transportation Demand Management (TDM) program for new development to reduce automobile travel by encouraging ride-sharing, carpooling, and alternative modes of transportation.

  Project consistency: Not applicable.
- R2-E1: New Construction Residential Energy Efficiency Requirements. Require energy efficient design for all new residential buildings to be 10 percent beyond the current Title 24 standards. (Reach Code)

  Project consistency: Consistent; the Project will comply with this measure if adopted by the City.
- R2-E2: New Construction Residential Renewable Energy. Facilitate the use of renewable energy (such as solar (photovoltaic) panels or small wind turbines) for new residential developments. Alternative approach would be the purchase of renewable energy resources offsite.

  Project consistency: Consistent; the Project will comply with this measure if adopted by the city.
- R2-E5: New Construction Commercial Energy Efficiency Requirements. Require energy efficient design for all new commercial buildings to be 10% beyond the current Title 24 standards. (Reach Code)

  Project consistency: Not applicable.
- R3-E1: Energy Efficient Development, and Renewable Energy Deployment Facilitation and Streamlining. Updating of codes and zoning requirements and guidelines to further implement green building practices. This could include incentives for energy efficient projects.
- Project consistency: Not applicable.

- R3-L2: Heat Island Plan. Develop measures that address "heat islands." Potential measures include using strategically placed shade trees, using paving materials with a Solar Reflective Index of at least 29, an open grid pavement system, or covered parking.

  Project consistency: Consistent; the Project will comply with the City of Moreno Valley's landscaping requirements.

- R2-W1: Water Use Reduction Initiative. Consider adopting a per capita water use reduction goal, which mandates the reduction of water use of 20 percent per capita with requirements applicable to new development and with cooperative support of the water agencies.

  Project consistency: Consistent. California Green Building Standards Code, Chapter 5, Division 5.3, Section 5.303.2 requires that indoor water use be reduced by 20 percent. The Project will be consistent with this measure.

- R3-W1: Water Efficiency Training and Education. Work with EMWD and local water companies to implement a public information and education program that promotes water conservation.

  Project consistency: Not applicable.

- R2-S1: City Diversion Program. For Solid Waste, consider a target of increasing the waste diverted from the landfill to a total of 75 percent by 2020.

  Project consistency: Consistent; the Project will comply with the City of Moreno Valley's citywide goal of solid waste reduction. Additionally the Project will be compliant with the City of Moreno Valley's Municipal Code 8.80.030 by implementing a Waste Management Plan.

As shown above, Project Consistency with Moreno Valley Energy Efficiency and Climate Action Strategy, of this report, many of the measures are not applicable to the project. The project is consistent with the applicable measures in the Strategy. Therefore, the project is consistent with the CAS.

3 PROJECT GREENHOUSE GAS IMPACT

3.1 INTRODUCTION

The Project has been evaluated to determine if it will result in a significant greenhouse gas impact. The significance of these potential impacts is described in the following section.

3.2 PROJECT RELATED GREENHOUSE GAS EMISSIONS

CEQA Guidelines 15064.4 (b) (1) states that a lead agency may use a model or methodology to quantify greenhouse gas emissions associated with a project (34).

On October 2, 2013, the SCAQMD in conjunction with the California Air Pollution Control Officers Association (CAPCOA) released the latest version of the California Emissions Estimator Model™ (CalEEMod™) v2013.2.2. The purpose of this model is to more accurately calculate construction-source and operational-source criteria pollutant (NO_x, VOC, PM_{10}, $PM_{2.5}$, SO_x, and CO) and greenhouse gas (GHG) emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures (35). Accordingly, the latest version of CalEEMod™ has been used for this Project to determine construction and operational air quality impacts. Output from the model runs for both construction and operational activity are provided in Appendix 3.1

3.3 CONSTRUCTION AND OPERATIONAL LIFE-CYCLE ANALYSIS

A full life-cycle analysis (LCA) for construction and operational activity is not included in this analysis due to the lack of consensus guidance on LCA methodology at this time. Life-cycle analysis (i.e., assessing economy-wide GHG emissions from the processes in manufacturing and transporting all raw materials used in the project development, infrastructure and on-going operations) depends on emission factors or econometric factors that are not well established for all processes. At this time a LCA would be extremely speculative and thus has not been prepared.

3.4 CONSTRUCTION EMISSIONS

Construction activities associated with the proposed Project will result in emissions of CO2 and CH4 from construction activities.

The report Ironwood Residential Air Quality Impact Analysis, Urban Crossroads, Inc. (2015) contains detailed information regarding construction activity (36).

For construction phase Project emissions, GHGs are quantified and amortized over the life of the Project. To amortize the emissions over the life of the Project, the SCAQMD recommends calculating the total greenhouse gas emissions for the construction activities, dividing it by the a 30 year project life then adding that number to the annual operational phase GHG emissions (37). As such, construction emissions were amortized over a 30 year period and added to the annual operational phase GHG emissions.

3.5 OPERATIONAL EMISSIONS

Operational activities associated with the proposed Project will result in emissions of CO2, CH4, and N2O from the following primary sources:

- Area Source Emissions
- Energy Source Emissions
- Mobile Source Emissions
- Solid Waste
- Water Supply, Treatment and Distribution

3.5.1 AREA SOURCE EMISSIONS

Hearths/Fireplaces

GHG emissions would result from the combustion of wood or biomass and are considered biogenic emissions of CO2. The emissions associated with use of hearths/fireplaces were calculated based on assumptions provided in the CalEEMod model. The Project is required to comply with SCAQMD Rule 445, which prohibits the use of wood burning stoves and fireplaces in new development. In order to account for the requirements of this Rule, the unmitigated CalEEMod model estimates were adjusted to remove wood burning stoves and fireplaces. As the project is required to comply with SCAQMD Rule 445, the removal of wood burning stoves and fireplaces is not considered "mitigation" although it must be identified as such in CalEEMod in order to treat the case appropriately.

Landscape Maintenance Equipment

Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shedders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. The emissions associated with landscape maintenance equipment were calculated based on assumptions provided in the CalEEMod model.

3.5.2 ENERGY SOURCE EMISSIONS

Combustion Emissions Associated with Natural Gas and Electricity

GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO2 and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions. Unless otherwise noted, CalEEMod™ default parameters were used.

3.5.3 Mobile Source Emissions

Vehicles

GHG emissions will also result from mobile sources associated with the Project. These mobile source emissions will result from the typical daily operation of motor vehicles by visitors, employees, and residents.

Project mobile source emissions are dependent on both overall daily vehicle trip generation. Trip characteristics available from the report, Ironwood Residential Traffic Impact Analysis (Urban Crossroads) 2015 were utilized in this analysis (38). A vehicle fleet mix consistent with the Caltrans ITS Transportation Project-Level Carbon Monoxide Protocol was used as shown in Table 3-1 (39). This fleet mix was utilized as it is more appropriate than the CalEEMod default fleet mix for residential land uses.

TABLE 3-1: PROJECT FLEET MIX

Vehicle Type	Fleet Mix %
Light Duty Autos	69 %
Light Duty Trucks	19.4 %
Medium Duty Trucks	6.4 %
Heavy Duty Trucks	4.7 %
Motorcycles	0.5 %

3.5.4 Solid Waste

Residential land uses will result in the generation and disposal of solid waste. A large percentage of this waste will be diverted from landfills by a variety of means, such as reducing the amount of waste generated, recycling, and/or composting. The remainder of the waste not diverted will be disposed of at a landfill. GHG emissions from landfills are associated with the anaerobic breakdown of material. GHG emissions associated with the disposal of solid waste associated with the proposed Project were calculated by the CalEEMod™ model using default parameters.

3.5.5 Water Supply, Treatment and Distribution

Indirect GHG emissions result from the production of electricity used to convey, treat and distribute water and wastewater. The amount of electricity required to convey, treat and distribute water depends on the volume of water as well as the sources of the water. Unless otherwise noted, CalEEMod™ default parameters were used.

3.6 Emissions Summary

The annual GHG emissions associated with the operation of the proposed Project are estimated to be 2,905.71 MTCO2e per year as summarized in Table 3-2. Direct and indirect operational emissions associated with the Project are compared with the SCAQMD threshold of significance for residential use projects, which is 3,000 MTCO2e per year (33). As shown, the proposed Project would result in a less than significant impact with respect to GHG emissions.

TABLE 3-2: TOTAL PROJECT GREENHOUSE GAS EMISSIONS (ANNUAL)

Emission Source	Emissions (metric tons per year)			
	CO_2	CH_4	N_2O	Total CO_2E
Annual construction-related emissions amortized over 30 years	40.79	4.06E-03	--	41.01
Area	46.51	3.81E-03	8.00E-04	46.84
Energy	589.38	2.00E-02	9.27E-03	592.75
Mobile Sources	2,197.25	0.07	--	2,063.59
Waste	43.11	2.55	--	96.62
Water Usage	53.76	0.39	9.70E-03	64.9
Total CO_2E (All Sources)	**2,905.71**			
SCAQMD Threshold	**3,000**			
Significant?	**NO**			

Source: CalEEMod™ model output, See Appendix 3.1 for detailed model outputs.
Note: Totals obtained from CalEEMod™ and may not total 100% due to rounding.
Table results include scientific notation. *e* is used to represent *times ten raised to the power of* (which would be written as x 10^{b}") and is followed by the value of the exponent
[a] Includes emissions of landscape maintenance equipment and architectural coatings emissions
[b] Includes emissions of natural gas consumption
[c] Includes emissions of vehicle emissions and fugitive dust related to vehicular travel

4 FINDINGS & CONCLUSIONS

The City of Moreno Valley has not adopted its own thresholds of significance for GHG emissions. As such, a screening threshold of 3,000 MTCO2e per year for residential land uses is applied herein, which is a widely accepted screening threshold accepted by the County of Riverside and numerous jurisdictions in the South Coast Air Basin and is based on the South Coast Air Quality Management District (SCAQMD) staff's proposed GHG screening threshold for stationary source emissions for non-industrial projects, as described in the SCAQMD's *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans* ("SCAQMD Interim GHG Threshold"). The SCAQMD Interim GHG Threshold identifies a screening threshold to determine whether additional analysis is required. (SCAQMD, 2008)

The Project will result in approximately 2,905.71 MTCO2e per year; the proposed project would not exceed the SCAQMD threshold of 3,000 MTCO2e per year. Thus, project-related emissions would not have a significant direct or indirect impact on GHG and climate change.

4.1 CONSTRUCTION AND OPERATIONAL-SOURCE MITIGATION MEASURES

No significant impacts occur, as such no mitigation is required.

APPENDIX 3.1:

CALEEMOD EMISSIONS MODEL OUTPUTS

This page intentionally left blank

Ironwood Residential- Construction

Riverside-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	181.00	Dwelling Unit	58.77	325,800.00	518

1.2 Other Project Characteristics

Urbanization Urban **Wind Speed (m/s)** 2.4 **Precipitation Freq (Days)** 28

Climate Zone 10 **Operational Year** 2020

Utility Company Southern California Edison

CO2 Intensity (lb/MWhr) 466.91 **CH4 Intensity (lb/MWhr)** 0.029 **N2O Intensity (lb/MWhr)** 0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CPUC GHG Calculator version 3c, worksheet tab "CO2 Allocations," cells AH/AQ 35-44.

Land Use - Project unit count is based on information provided by the applicant

Construction Phase - Based on consultation with the applicant

Off-road Equipment - 8 hour work days

Off-road Equipment - 8 hour work days

Off-road Equipment - Water truck added

Off-road Equipment -

Grading -

Vehicle Trips - Construction run only

Woodstoves - Construction run only

Energy Use - Construction run only

Construction Off-road Equipment Mitigation -

10.0 Vegetation

Ironwood Residential- Operation

Riverside-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	181.00	Dwelling Unit	58.77	325,800.00	518

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2020
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	466.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CPUC GHG Calculator version 3c, worksheet tab "CO2 Allocations," cells AH/AQ 35-44.

Land Use - Project unit count is based on information provided by the applicant

Construction Phase - Operation run only

Off-road Equipment - 8 hour work days

Off-road Equipment - Operation run only

Grading -

Vehicle Trips - Weekday TR based on the Ironwood Residential TIA. Weekend TR based on the ITE Trip Generation Manual (code 210)

Woodstoves - No wood stoves, all natural gas fireplaces

Energy Use - Title-24 Electricity Energy Intensity and Title-24 Natural Gas Energy Intensity were adjusted by 36.4% and 6.5% respectively, to reflect 2013 Title 24 requirements. Source: Impact Analysis California's 2013 Building Energy Efficiency Standards (CEC 2013)

Construction Off-road Equipment Mitigation -

Vechicle Emission Factors - Based on Caltrans ITS Transportation Project-Level Carbon Monoxide Protocol

Vechicle Emission Factors - Based on Caltrans ITS Transportation Project-Level Carbon Monoxide Protocol

Vechicle Emission Factors - Based on Caltrans ITS Transportation Project-Level Carbon Monoxide Protocol

Moreno Valley Ironwood Rockfall Investigation

Riverside County, California

Project No. KGT 16-05

1. INTRODUCTION

1.1 General

KANE GeoTech, Inc. (KANE GeoTech) was retained by Global Investment and Development, LLC to investigate any potential rockfall hazard affecting the location of a planned residences in the City of Moreno Valley on Ironwood Avenue, located in Riverside County, California. This report was prepared by KANE GeoTech to provide detailed information on the assessment of potential rockfall hazards at the Project site. The Project location, Tentative Tract No. 37001, is shown in Figure 1 with an aerial overview of the site in Figure 2. A lot map of the planned development is included as Appendix A.

1.2 Purpose

The purpose of this report is to present the results of the field investigation and rockfall analyses performed to assess the potential rockfall hazards at the Project site.

2. SCOPE OF WORK

2.1 Scope

The scope of services provided by KANE GeoTech included the following:

1. *Literature Review*. KANE GeoTech reviewed existing geotechnical information, reports, and maps pertinent to the project area.

2. *Site Investigation.* KANE GeoTech visited the site to evaluate the site conditions and gather data necessary to perform a rockfall analyses.

3. *Engineering Analysis.* KANE GeoTech performed a rockfall analyses using the Colorado Rockfall Simulation Program to assess the potential rockfall hazard present at the site.

Figure 1. Project location.

Figure 2. Aerial overview of project site.

4. *Report of Findings.* KANE GeoTech provides this Report of Findings stamped by a Licensed California Civil Engineer experienced in rockfall. This Report contains a summary of the site investigation and engineering analysis.

3. SITE DESCRIPTION

3.1 Overview

The Project site, Tentative Tract No. 37001, is a planned residential area located at approximately latitude 33°56'56'' N and longitude 117°11'16'' W, in Moreno Valley, Riverside County, California. Several of the planned residences are on a flat area at the base of a rocky outcrop. This slope is the source of any potential rockfall. At the time of our visit, most of the area was covered by short grass.

3.2 Regional Geology

The project site is generally located south of the San Gregorio Mountains in Southern California, northeast of the Santa Ana Mountains, and southeast of Box Springs Mountain. This area is a part of the Perris Block which is bounded by the Elsinore Fault, located to the southwest and the Jacinto Fault to the northeast (City, 2006). The area is a part of the Southern California batholith that is composed of felsic rich, intrusive igneous bedrock.

3.3 Site Geology

The site is located at the southeastern base of the Kalmia Hills in the northern section of the Perris Block. The bedrock present at the site is mainly biotite-hornblende tonalite not associated with an specific pluton (USGS, 1967). The tonalite is grey, medium-grained and in some areas contains mafic inclusions.

The slope adjacent to the planned resident locations contains spheroidally weathered, large, rounded boulders. These boulders are composed of the tonalite described above. The boulders are heavily weathered and when broken down, form the sandy soil present at the site. The majority of these boulders are embedded in the sediment or are actually exposed bedrock. There are some areas of exposed bedrock indicating the depth to bedrock, although varies, is shallow.

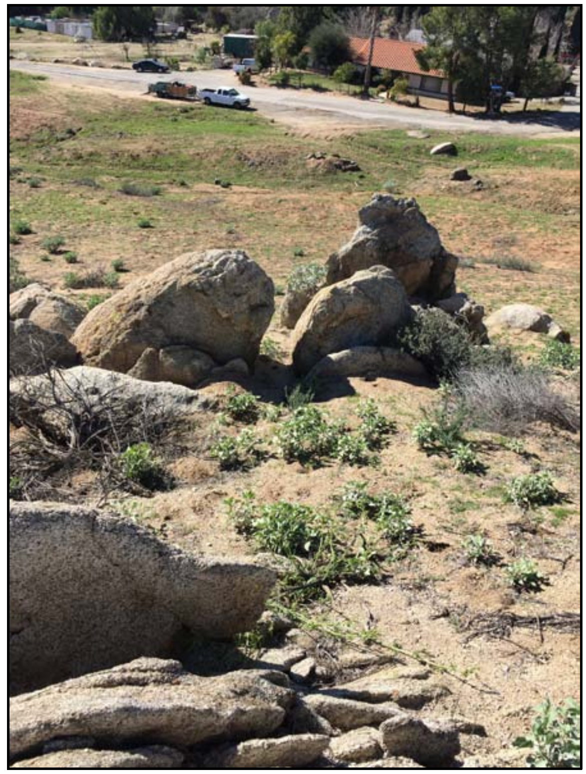

Figure 3. Large embedded boulders and exposed bedrock outcrops.

4. SITE EVALUATION

4.1 Background

KANE GeoTech visited the project site on February 2, 2016. The purpose of the visit and field investigation was to collect data required for analyses to determine the nature and extent of any rockfall hazards. Details and data were recorded with photos and in a field notebook. Rock type, boulder size, and probable paths of rockfall, and soil cover were noted.

4.2 Observations

The areas of concern consist of embedded rounded boulders. Approximately 95% of them are embedded in a soft sediment, Figure 3. These boulders weather into smaller spheroidal boulders with a maximum diameter of 1-ft, Figure 4. These 1-ft boulders were observed sporadically throughout the project site. There is minimal vegetation present at the site and consists of shrubs and grasses. Six different slopes have been observed and are presented in Appendix B.

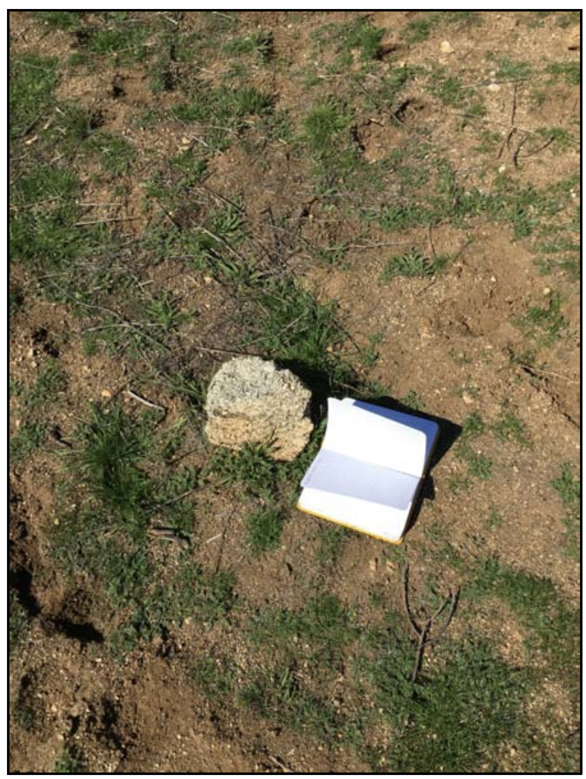

Figure 4. Typical rockfall observed at the site.

Lots 36 through 42 mostly consisted of large embedded boulders. Also present at this location were blocky, rounded boulders that could potentially mobilize during a seismic event. These boulders may detach during such events, but are very unlikely to impact the planned residence locations. There were no indications of rockfall exceeding the 1-ft diameter boulders at any of the planned lot locations.

A large, feldspar vein was observed at the site near Lots 41 and 42. This vein maybe be continuous throughout the site, but was only exposed in this area. The vein is hard, and resistant to erosion. The thickness is unknown, Figure 5.

Figure 5. Exposed feldspar vein .

Lot 171, located on the east end of the project site was an additional area of concern. Lot 171 is composed of the same rounded, embedded boulders as the west end of the site. No boulders exceeding 1-ft in diameter was found at the location of planned residence construction.

5. ROCKFALL ANALYSES

5.1 Method of Analyses

Rockfall analyses of the slope utilized computer modeling. The Colorado Rockfall Simulation Program (CRSP) was used to simulate and analyze rockfall events.

5.2 Colorado Rockfall Simulation Program (CRSP)

Common practice in the analyses of slope rockfall is to use CRSP (Jones, et al., 2000). It is also possible to estimate how far a rock will travel along a slope by conducting actual rock rolling tests. While these tests may be useful in verifying criteria, they are expensive and are limited by the small number of rocks that can be rolled. In contrast, thousands of simulated rolls can be made using CRSP.

CRSP uses a computer algorithm based on actual rockfall tests to predict the distance a rock will stop from the toe of a slope, the velocity of the rock, how high the rock is likely to bounce, and the kinetic energy of the rock at any point. CRSP requires a slope profile, and an estimate of parameters such as rock unit weight, size, and slope roughness in addition to normal and tangential coefficients of restitution along the slope. CRSP provides an image of the slope profile with simulated rockfall, Figure 6, and can then compute the dynamic parameters of rockfall events, that is, the velocity, kinetic energy, and bounce height.

By modeling a slope using CRSP, it is possible to make some reasoned judgements on the need for, or the design of, a rockfall fence or impact wall. The CRSP algorithm has been validated by field data. It is routinely used as a design tool by the California Department of Transportation (Caltrans) and many other state highway departments.

After evaluating the site, it was determined that certain areas were most susceptible to rockfall and were chosen for the analyses. Rockfall parameters used in the analyses were based on field data and topographic maps. The collected field data included determination of surface conditions, boulder sizes, and soil properties.

Six slope profiles were analyzed with surface characteristics based on observed site conditions. Figure 6 shows a typical profile. Each profile was analyzed with surface characteristics based on observed slope conditions and boulder size. CRSP rockfall analyses were performed for the slope using 1,000 simulated rock rolls with rock shape and size applicable to the most hazardous boulders located in that zone. For these analyses, vegetation was not considered a factor in energy dissipation.

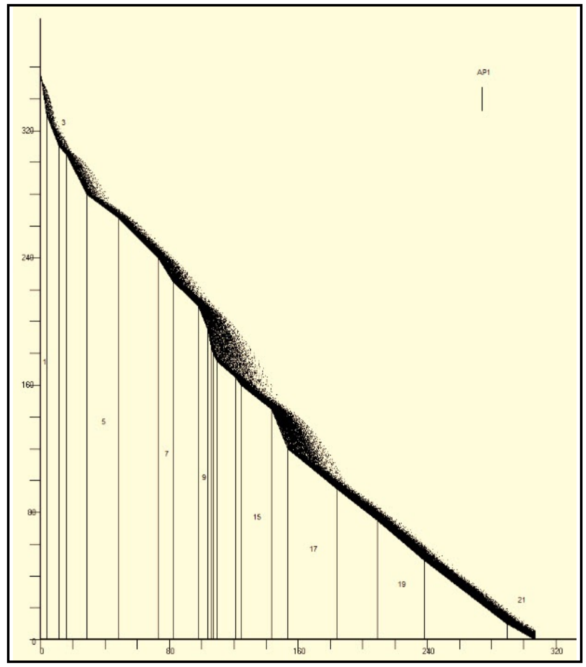

Figure 6. Typical CRSP profile..

The model boulders were assumed to have a unit weight of 165-pcf, typical of a intrusive, felsic, igneous rock (Hunt,1984), and maximum dimensions of 2-ft by 3-ft. Velocity, bounce heights, and kinetic energies were determined along each profile.

The profiles were assigned Analyses Points (AP) that were placed at the planned residence locations (AP1) to determine the probable rockfall hazard. Velocity, bounce heights, and kinetic energies were determined at the AP for each profile.

6. RESULTS AND DISCUSSION

6.1 Overview

Field investigations and rockfall analyses were performed and conclusions were made using generally accepted geotechnical engineering principles and incorporating currently available information, equipment and methods.

6.2 CRSP Results and Discussion

CRSP was utilized to model six profiles, chosen due to slope geometry and boulder locations. After the completion of the analyses, it was determined that the planned residences after not expected to be impacted by rockfall. The full results from CRSP, including all inputs and slope geometry, can be found in the Appendix A.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

Based on the results of the field studies and rockfall analyses, the following conclusions and recommendations are reported below. It is our opinion that:

1. **Some minor rockfall onto the slope may occur.** The rockfall source will continue to weather and erode and is likely to produce rockfall onto the slope. Based on the our observations and CRSP modeling, the proposed locations of the residences should not be affected.

2. **Rockfall mitigation is not necessary.** After rockfall simulation analyses, it is our opinion that rockfall mitigation is not necessary for the proposed location of the residences. It will, however, be beneficial to construct reinforced concrete or block privacy walls at Lots 36, 37, 38, 39, and 40 to provide supplementary protection and prevent any small, nuisance rockfall from accumulating in residential areas.

9. LIMITATIONS

The analyses, conclusions and recommendations contained in this report are based on the site conditions observed by us and derived from the information provided to us. If there is a substantial lapse of time between the submission of our report and the start of any work at the site, or if conditions have changed due to natural causes, mining or construction operations at or adjacent to the site, we urge that our report be reviewed to determine the applicability of the conclusions and recommendations considering the changed conditions and time lapse. This report is applicable only for the project and sites studied. This report should not be used after three years.

Our professional services were performed, our findings obtained, and our recommendations proposed in accordance with generally accepted engineering principles and practices. This warranty is in lieu of all other warranties either expressed or implied. Findings and statements of professional opinion do not constitute a guarantee or warranty, expressed or implied.

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the noise exposure and the necessary noise mitigation measures for the proposed Ironwood Residential (TTM No. 37001) development ("Project"). The Project site is located north of Ironwood Avenue and between Nason Street and Oliver Street in the City of Moreno Valley. The Project is proposed to include the development of up to 181 single-family detached residential dwelling units. The purpose of this noise analysis is to ensure that the proposed development is compatible with the existing and future noise environment. This study has been prepared to satisfy the City of Moreno Valley noise standards for residential land uses.

OFF-SITE TRAFFIC NOISE ANALYSIS

Traffic generated by the proposed Project will influence the traffic noise levels in surrounding off-site areas. To quantify the off-site traffic noise increases on the surrounding off-site areas, the changes in traffic noise levels on nine roadway segments surrounding the Project site were estimated based on the change in the average daily traffic (ADT) volumes. The traffic noise levels provided in this analysis are based on the traffic forecasts found in the *Ironwood Residential (TTM No. 37001) Traffic Impact Analysis* prepared by Urban Crossroads, Inc. (1) To assess the off-site noise level impacts associated with the proposed Project, noise contour boundaries were developed for Existing, Year 2020, and Year 2035 traffic conditions. The off-site traffic noise analysis indicates that the Project's contributions to roadway noise levels at adjacent sensitive land uses will be *less than significant* for Existing, Year 2020, and Year 2035 conditions.

ON-SITE NOISE ANALYSIS

The results of this analysis indicate that future vehicle noise from Ironwood Avenue is the principal source of community noise that will impact the Project site. The Project will also experience some background traffic noise impacts from Nason Street, Oliver Street, and the Project's internal roads, however due to the distance, topography and low traffic volume/speeds, traffic noise from these roads will not make a significant contribution to the noise environment. The following on-site noise mitigation measures recommended in this noise analysis have been designed to reduce the exterior and interior noise levels to satisfy the City of Moreno Valley transportation related CNEL noise criteria for residential development. With the recommended noise mitigation measures shown on Exhibit ES-A, the on-site noise impacts will be *less than significant*.

EXTERIOR NOISE MITIGATION

To satisfy the City of Moreno Valley 65 dBA CNEL exterior noise level standards for residential land use, the construction of 4-foot high noise barriers for the outdoor living areas (backyards) of lots 26 to 30 is required. With the recommended noise barriers shown on Exhibit ES-A, the mitigated future exterior noise levels will range from 61.5 to 63.3 dBA CNEL. This noise analysis shows that the recommended noise barriers will satisfy the City of Moreno Valley 65 dBA CNEL exterior noise level standards. The recommendations identify the minimum required noise barrier height to satisfy the City of Moreno Valley exterior noise level standards.

The recommended noise control barriers shall be constructed so that the top of each wall extends to the recommended height above the pad elevation of the lot it is shielding. When the road is elevated above the pad elevation, the barrier shall extend to the recommended height above the highest point between the residential home and the road. The barriers shall provide a weight of at least 4 pounds per square foot of face area with no decorative cutouts or line-of-sight openings between shielded areas and the roadways. The noise barrier shall be constructed using one of the following materials:

- Masonry block
- Stucco veneer over wood framing (or foam core), or 1 inch thick tongue and groove wood of sufficient weight per square foot
- Glass (1/4 inch thick), or other transparent material with sufficient weight per square foot
- Earthen berm
- Any combination of these construction materials

The barrier must present a solid face from top to bottom. Unnecessary openings or decorative cutouts shall not be made. All gaps (except for weep holes) should be filled with grout or caulking.

Interior Noise Mitigation

To satisfy the City of Moreno Valley 45 dBA CNEL interior noise level criteria, a Noise Reduction (NR) of up to 21.4 dBA and a windows closed condition requiring a means of mechanical ventilation (e.g. air conditioning) are required for lots adjacent to Ironwood Avenue. In order to meet the City of Moreno Valley 45 dBA CNEL interior noise standards the Project shall provide the following or equivalent noise mitigation measures:

- <u>Windows</u>: All windows and sliding glass doors shall be well fitted, well weather-stripped assemblies and shall have a minimum STC rating of 27.
- <u>Doors</u>: All exterior doors shall be well weather-stripped solid core assemblies at least one and three-fourths-inch thick.
- <u>Roof:</u> Roof sheathing of wood construction shall be well fitted or caulked plywood of at least one-half inch thick. Ceilings shall be well fitted, well-sealed gypsum board of at least one-half inch thick.
- <u>Attic:</u> Attic vents should be oriented away from Ironwood Avenue. If such an orientation cannot be avoided, then an acoustical baffle shall be placed in the attic space behind the vents. Insulation with at least a rating of R-19 shall be used in the attic space.
- <u>Ventilation:</u> When any habitable room is in use, arrangements shall be such that circulated air is received when any exterior door(s) or window(s) are closed. A forced air circulation system (e.g. air conditioning) or active ventilation system (e.g. fresh air supply) shall be provided which satisfies the requirements of the Uniform Building Code.

With the interior noise mitigation measures provided in this study, the proposed Ironwood Residential (TTM No. 37001) Project is expected to meet the City of Moreno Valley 45 dBA CNEL interior noise level standards.

Construction Noise and Vibration Analysis

Construction noise represents a short-term impact on the ambient noise levels. Based on the four phases of Project construction, the construction-related noise impacts are expected to create temporary and intermittent high-level noise conditions at receivers surrounding the Project site when certain activities occur at the center of construction activity.

The peak construction noise levels are expected to range from 46.2 to 56.6 dBA Leq with the attenuation provided by the recommended temporary construction noise barriers and noise mitigation measures provided below. With the temporary noise control barriers providing a minimum attenuation of 10 dBA, the construction noise levels will satisfy the 60 dBA Leq construction noise level threshold at the nearby sensitive receivers. Therefore, the construction of the Project will result in a *less than significant* noise impact.

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. This analysis shows the construction vibration levels are expected to approach 64.6 VdB at the nine receiver locations. Based on the FTA vibration standard of 80 VdB, the proposed Project site will not include or require equipment, facilities, or activities that would result in a barely perceptible human response (annoyance), and therefore, impacts due to vibration are considered *less than significant*.

Construction Noise and Vibration Abatement Measures

Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following practices would reduce any noise level increases produced by the construction equipment to the nearby noise-sensitive residential land uses:

- Prior to approval of grading plans and/or issuance of building permits, plans shall include a note indicating that noise-generating Project construction activities shall only occur between the hours of 7:00 a.m. and 8:00 p.m. on any day. The Project construction supervisor shall ensure compliance with the note and the City shall conduct periodic inspection at its discretion.
- Install temporary noise control barriers that provide a minimum noise level attenuation of 10 dBA when Project construction occurs near existing noise-sensitive structures. The noise control barrier must present a solid face from top to bottom. The noise control barrier must be high enough and long enough to block the view of the noise source. Unnecessary openings shall not be made.
    - The noise barrier may be constructed using an acoustical blanket (e.g. vinyl acoustic curtains or quilted blankets) attached to the construction site perimeter fence or equivalent temporary fence posts.

  - The noise barriers must be maintained and any damage promptly repaired. Gaps, holes, or weaknesses in the barrier or openings between the barrier and the ground shall be promptly repaired.
  - The noise control barriers and associated elements shall be completely removed and the site appropriately restored upon the conclusion of the construction activity.
- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site (i.e., to the north) during all Project construction.
- The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment (between the hours of 7:00 a.m. and 8:00 p.m. on any day). The contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed Ironwood Residential (TTM No. 37001) ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, describes the local regulatory setting, provides the study methods and procedures for traffic noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related short-term construction noise impacts.

1.1 SITE LOCATION

The proposed Ironwood Residential (TTM No. 37001) site is located north of Ironwood Avenue and between Nason Street and Oliver Street in the City of Moreno Valley, as shown on Exhibit 1-A. The Project site is currently vacant. Existing single-family residential homes are located to the west, east, and south of the Project site. The State Route 60 (SR-60) Freeway is located approximately one half mile south of the Project site.

1.2 PROJECT DESCRIPTION

The Project is proposed to include the development of up to 181 single-family detached residential dwelling units, as shown on Exhibit 1-B.

Exhibit 1-A: Location Map

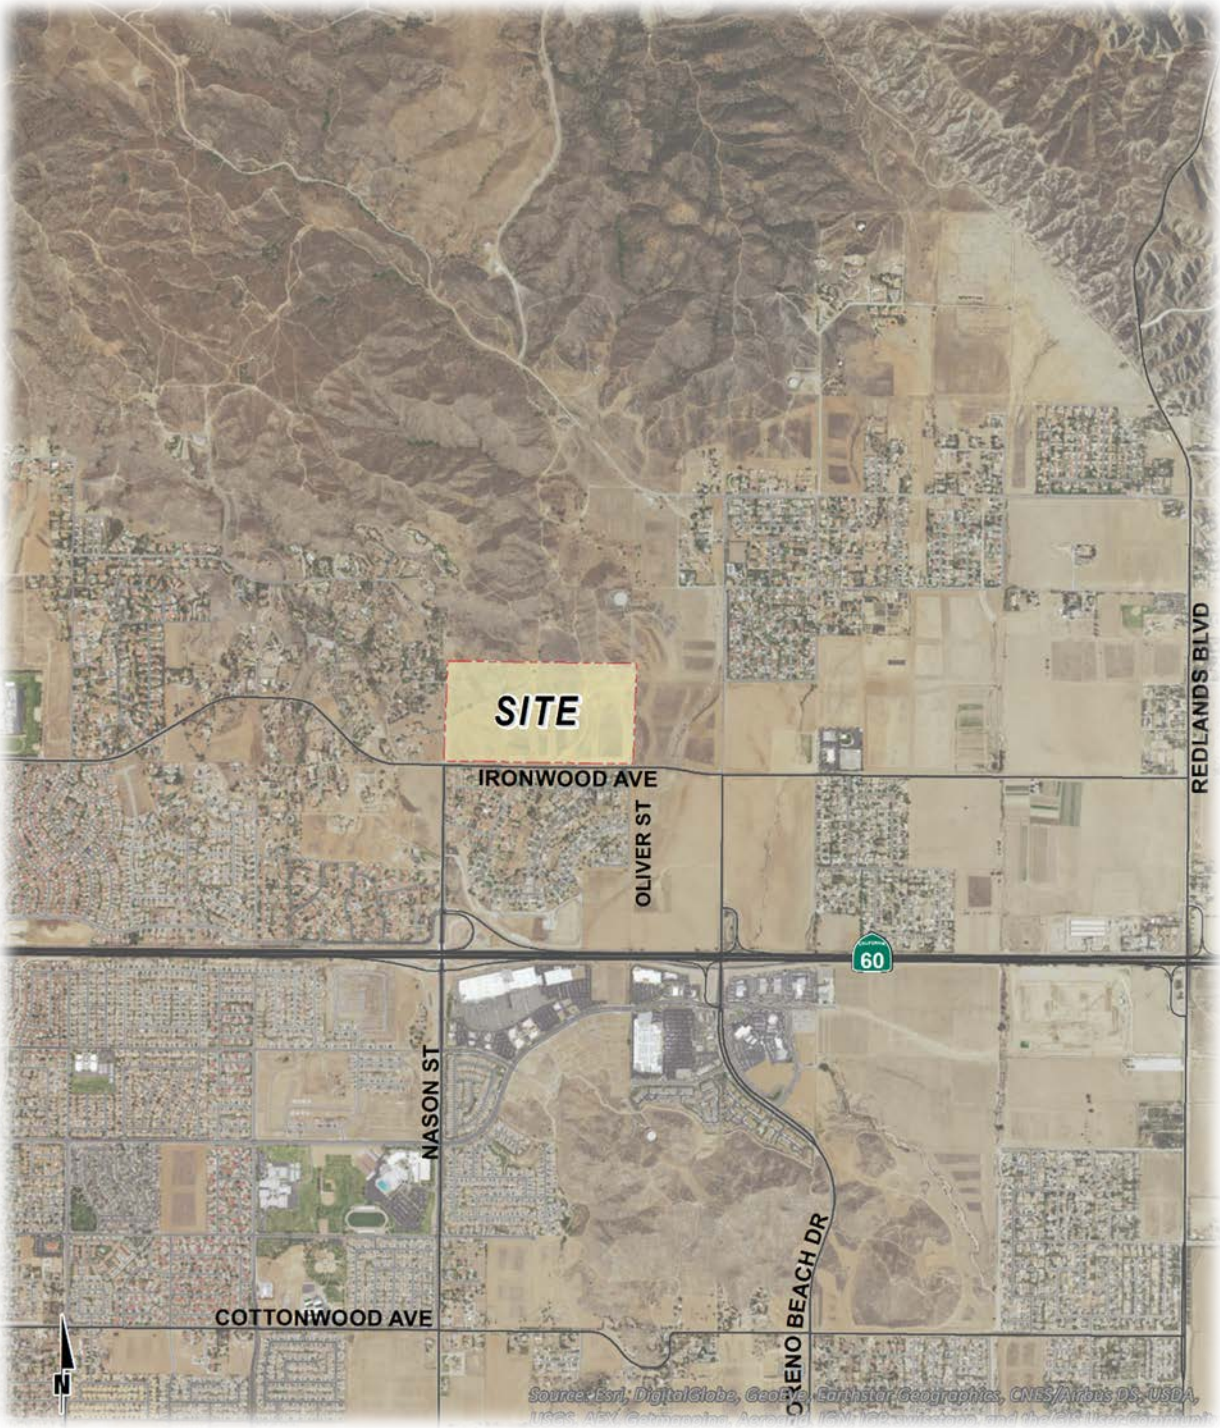

EXHIBIT 1-B: SITE PLAN

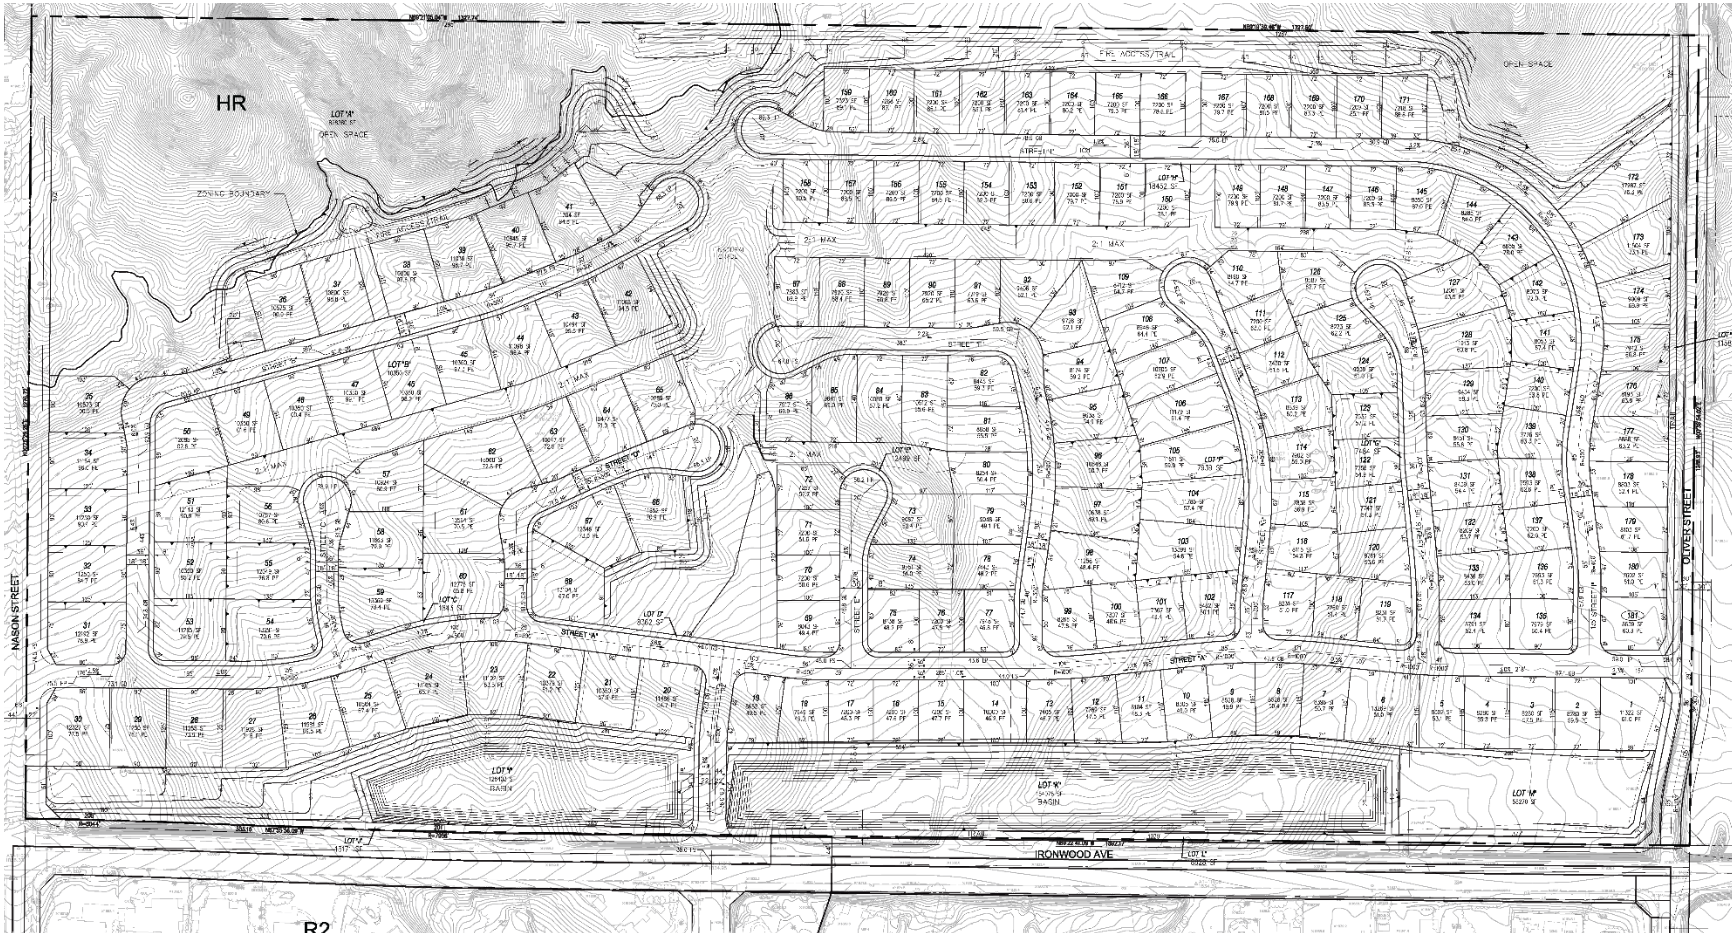


This page intentionally left blank

2 FUNDAMENTALS

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140		
NEAR JET ENGINE		130	INTOLERABLE OR DEAFENING	
		120		HEARING LOSS
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100		
GAS LAWN MOWER AT 1m (3 ft)		90	VERY NOISY	
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	SPEECH INTERFERENCE
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		SLEEP DISTURBANCE
QUIET SUBURBAN NIGHTTIME	LIBRARY	30	FAINT	
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		NO EFFECT
	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0		

Source: Environmental Protection Agency Office of Noise Abatement and Control, Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (EPA/ONAC 550/9-74-004) March 1974.

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (2) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA at approximately 100 feet, which can cause serious discomfort. (3) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 Noise Descriptors

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (Leq). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than the peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite twenty-four hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of 5 decibels to dBA Leq sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA Leq sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise-sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any particular time, but rather represents the total sound exposure. The City of Moreno Valley relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 Sound Propagation

When sound propagates over a distance, it changes in level and frequency content. The manner in which noise reduces with distance depends on the following factors.

2.3.1 Geometric Spreading

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source.

2.3.2 Ground Absorption

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receptor such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source.

2.3.3 ATMOSPHERIC EFFECTS

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects.

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an “out of sight, out of mind” effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure.

2.4 TRAFFIC NOISE PREDICTION

Vehicle noise is a combination of the noise produced by the engine, exhaust, and tires on the roadway. According to the *Highway Traffic Noise Analysis and Abatement Policy and Guidance,* provided by the Federal Highway Administration (FHWA), the level of traffic noise depends on three primary factors: the volume of the traffic, the speed of the traffic, and the vehicle mix within the flow of traffic. Generally, the loudness of traffic noise is increased by heavier traffic volumes, higher speeds, and a greater number of trucks. (4) A doubling of the traffic volume, assuming that the speed and vehicle mix do not change, results in a noise level increase of 3 dBA. The vehicle mix on a given roadway may also have an effect on community noise levels. As the number of medium and heavy trucks increases and becomes a larger percentage of the vehicle mix, adjacent noise level impacts will increase.

2.5 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for a particular observation point or receptor by controlling the noise source, transmission path, receptor, or all three. This concept is known as the source-path-receptor concept. In general, noise control measures can be applied to any and all of these three elements.

2.6 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receptor. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (4)

2.7 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (5)

2.8 COMMUNITY RESPONSE TO NOISE

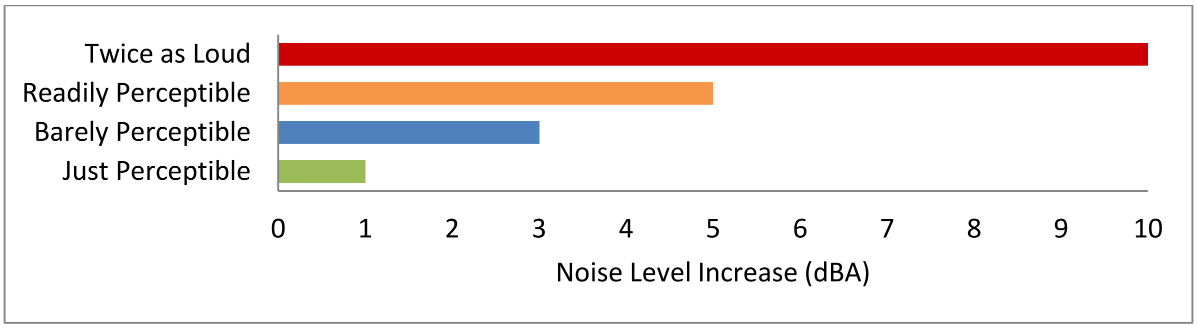
Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon each individual's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Another twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (6) Surveys have shown that about ten percent of the people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (6)

Despite this variability in behavior on an individual level, the population as a whole can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. An increase or decrease of 1 dBA cannot be perceived except in carefully controlled laboratory experiments, a change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (4)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.9 VIBRATION

According to the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Assessment* (7), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings, but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal, and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains fairly constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared according to guidelines adopted by the Governor's Office of Planning and Research. (8) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

3.2 STATE OF CALIFORNIA BUILDING CODE

The State of California's noise insulation standards are codified in the California Code of Regulations, Title 24, Building Standards Administrative Code, Part 2, and the California Building Code. These noise standards are applied to new construction in California for the purpose of controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as residential buildings, schools, or hospitals, are developed near major transportation noise sources, and where such noise sources create an exterior noise level of 60 dBA CNEL or higher. Acoustical studies that accompany building plans for noise-sensitive land uses must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new residential buildings, schools, and hospitals, the acceptable interior noise limit for new construction is 45 dBA CNEL.

3.3 CITY OF MORENO VALLEY GENERAL PLAN SAFETY ELEMENT

The City of Moreno Valley General Plan does not include a noise element or specific transportation-related noise standards. Rather, noise is considered in Section 6.4 of the Environmental Safety section of the General Plan Safety Element. (9) While the General Plan provides background and noise fundamentals, it does not identify criteria to assess the impacts associated with off-site transportation-related noise impacts. Instead, the General Plan includes policies associated with each element in Chapter 9, *Goals and Objectives*. The objectives identified in Chapter 9 of the City of Moreno Valley General Plan to address potential noise impacts are listed below:

Objective 6.3 *Provide noise compatible land use relationships by establishing noise standards utilized for design and siting purposes.*

Objective 6.4 *Review noise issues during the planning process and require noise attenuation measures to minimize acoustic impacts to existing and future surrounding land uses.*

Objective 6.5 *Minimize noise impacts from significant noise generators such as, but not limited to, motor vehicles, trains, aircraft, commercial, industrial, construction, and other activities.*

The City of Moreno Valley General Policies (pg. 9-31, 9-32) act to ensure that when exterior noise levels exceed 65 dBA CNEL at sensitive land uses (Policy 6.3.1), mitigation is provided to ensure that interior noise levels of 45 dBA CNEL are maintained. General Plan Policies in this regard are consistent with, and support, the California Building Code interior noise standards previously discussed in Section 3.2.

3.4 CITY OF MORENO VALLEY MUNICIPAL CODE NOISE STANDARDS

The most effective method to control community noise impacts from non-transportation noise sources (such as playgrounds, trash compactors, air-conditioning units, etc.) is through the application of a noise control ordinance. For the purpose of this analysis, the potential non-transportation noise impacts include Project-related short-term construction activities during the permitted hours of construction established in the Municipal Code. The City of Moreno Valley Municipal Code is included in Appendix 3.1.

As a subset of its stationary-source noise regulations, the City of Moreno Valley Municipal Code establishes restrictions on construction-source noise. More specifically, Municipal Code Section 11.80.030(D)(7), *Construction and Demolition*, provides the following:

> *No person shall operate or cause operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee.*

The City of Moreno Valley defines a *noise disturbance* as any sound which:

> *Disturbs a reasonable person of normal sensitivities; exceeds the sound level limits set forth in this chapter* [Section 11.80.030(C)]*; or is plainly audible as defined in this section. Where no specific distance is set forth for the determination of audibility, references to noise disturbance shall be deemed to mean plainly audible at a distance of two (200) feet from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right of way, public space or other publicly owned property.*

Therefore, Project construction shall be limited to the hours of 7:00 a.m. to 8:00 p.m. on any day and may not generate a noise level at 200 feet from the property line which exceeds the noise standards provided in the Noise Ordinance, Section 11.80.030(C), *Non-impulsive Sound Decibel Limits*, which states the following:

> *No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any non-impulsive sound which exceeds the limits set forth for the source land use category in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance*. (10)

Even though the City of Moreno Valley Municipal Code does not identify specific construction noise limits; it does provide noise level limits for the source land use category when measured at a distance of 200 feet. For the purpose of this analysis, the Ironwood Residential (TTM No. 37001) Project is considered *Residential* land use since it is *land primarily for dwelling units*, as defined by the City of Moreno Valley Municipal Code. For residential land uses, the City of Moreno Valley 60 dBA Leq noise level standard at a distance of 200 feet is used as the limit for this analysis to assess the construction noise level impacts at sensitive receivers in the Project study area. Therefore, to conform to the applicable provisions of the Municipal Code, the maximum allowable noise generated by on-site construction activities when measured at 200 feet from any property line, shall not exceed 60 dBA Leq. The City of Moreno Valley construction noise standards are shown on Table 3-1 and included in Appendix 3.1.

TABLE 3-1: CONSTRUCTION NOISE STANDARDS

Jurisdiction	Permitted Hours of Construction Activity	Construction Noise Level Standard
City of Moreno Valley[1]	Between 7:00 a.m. and 8:00 p.m. on any day	60 dBA Leq @ 200'

[1] Source: City of Moreno Valley Municipal Code, Section 11.80.030(D)(7) (Appendix 3.1).

3.5 CONSTRUCTION VIBRATION STANDARDS

To analyze the vibration impacts originating from the construction of the Project, vibration from construction activities are typically evaluated against standards established under a City's Municipal Code. The City of Moreno Valley Municipal Code, however, does not identify specific vibration standards for construction. Therefore, the construction-related vibration standards provided by the United States Department of Transportation Federal Transit Administration (FTA) are used in this analysis to assess the potential vibration impacts due to Project construction.

3.6.1 FTA VIBRATION STANDARDS

The FTA identifies guidelines for maximum-acceptable vibration criteria for different types of land uses. (7) These guidelines allow 80 VdB for residential uses and buildings where people normally sleep. Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. Occasionally large bulldozers and loaded trucks can cause perceptible vibration levels at close proximity. While not enforceable regulations within the City of Moreno Valley, the FTA guidelines of 80 VdB for sensitive land uses provide the basis for determining the relative significance of potential Project-related vibration impacts.

3.6.2 HUMAN PERCEPTION OF VIBRATION

Typically, the human response at the perception threshold for vibration includes annoyance in residential areas when vibration levels, expressed in vibration decibels (VdB), approach 75 VdB as previously shown on Exhibit 2-C. As discussed in Section 2.9, ground-borne vibration is normally perceptible to humans at approximately 65 VdB and, for most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. For this analysis, the FTA-provided 80 VdB vibration standard represents residential annoyance as perceived by the nearby sensitive receivers in the Project study area.

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. For the purposes of this report, impacts would be potentially significant if the Project is determined to result in or cause:

A. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

B. Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels.

C. A substantial permanent increase in ambient noise levels in the Project vicinity above existing levels without the proposed Project; or

D. A substantial temporary or periodic increase in ambient noise levels in the Project vicinity above noise levels existing without the proposed Project.

While the CEQA Guidelines and the City of Moreno Valley General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts under the first threshold, they do not define the levels at which increases are considered substantial for use under the second, third and fourth threshold. Under CEQA, consideration must be given to the magnitude of the increase, the existing ambient noise levels and the location of noise-sensitive receivers in order to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (11)

Unfortunately, there is no completely satisfactory way to measure the subjective effects of noise or of the corresponding human reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment.

In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged. With this in mind, the Federal Interagency Committee on Noise (FICON) developed guidance to be used for the assessment of project-generated increases in noise levels that take into account the ambient noise level. (12) The FICON recommendations are based on studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (i.e., CNEL).

For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur even though the noise criteria might not be exceeded. Therefore, for the purpose of this analysis, FICON identifies a *readily perceptible* 5 dBA or greater project related noise level increase is considered a significant impact when nearby noise-sensitive receivers are affected. According to the FICON, in areas where the without project noise levels range from 60 to 65 dBA, a 3 dBA *barely perceptible* noise level increase appears to be appropriate for most people. When the without project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if noise-sensitive receivers are affected, since it likely contributes to an existing noise exposure exceedance. Table 4-1 below provides a summary of the potential noise impact significance criteria, based on guidance from FICON.

TABLE 4-1: SIGNIFICANCE OF NOISE IMPACTS

Without Project Noise Level	Potential Significant Impact
< 60 dBA	5 dBA or more
60 - 65 dBA	3 dBA or more
> 65 dBA	1.5 dBA or more

Federal Interagency Committee on Noise (FICON), 1992.

Based on the significance of noise impacts outlined below on Table 4-2, noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development:

Off-Site Traffic Noise

- If the off-site traffic noise levels at nearby noise-sensitive land uses adjacent to roadways conveying Project traffic:
  - are less than 60 dBA CNEL and the Project creates a *readily perceptible* 5 dBA CNEL or greater Project related noise level increase; or
  - range from 60 to 65 dBA CNEL and the Project creates a *barely perceptible* 3 dBA CNEL or greater Project noise level increase; or
  - already exceed 65 dBA CNEL, and the Project creates a community noise level impact of greater than 1.5 dBA CNEL (FICON, 1992.).

On-Site Traffic Noise

- If the on-site exterior noise levels exceed 65 dBA CNEL at the residential land uses within the Project site. Interior noise levels shall not exceed 45 dBA CNEL for residential land uses (City of Moreno Valley General Noise Element, Policy 6.3.1).

Construction Noise and Vibration

- If Project-related construction activities:
  - occur anytime other than between the permitted hours of 7:00 a.m. to 8:00 p.m. on any day (City of Moreno Valley Municipal Code Section 11.80.030(D)(7)); or
  - create noise levels at sensitive residential receivers in the City of Moreno Valley which exceed the short-term construction noise level limit of 60 dBA Leq at 200 feet from the Project site (City of Moreno Valley Municipal Code, Section 11.80.030(D)(7)).

- If short-term Project generated construction vibration levels exceed the FTA maximum acceptable vibration standard of 80 VdB at sensitive receiver locations (FTA Transit Noise and Vibration Impact Assessment, May 2006).

TABLE 4-2: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Condition(s)	Significance Criteria	
		Daytime	Nighttime
Off-Site[1]	if ambient is < 60 dBA CNEL	≥ 5 dBA CNEL Project increase	
	if ambient is 60 - 65 dBA CNEL	≥ 3 dBA CNEL Project increase	
	if ambient is > 65 dBA CNEL	≥ 1.5 dBA CNEL Project increase	
On-Site[2]	Exterior residential land use	65 dBA CNEL	
	Interior residential land use	45 dBA CNEL	
Construction[3]	Permitted hours of 7:00 a.m. to 8:00 p.m. on any day.		
	Noise Level Threshold	60 dBA Leq @ 200'	n/a
	Vibration Level Threshold[4]	80 VdB	n/a

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, five 24-hour noise level measurements were taken at sensitive receiver locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Wednesday, January 28th, 2015. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (13)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned at the nearest sensitive receiver locations to assess the existing ambient hourly noise levels surrounding the Project site. To describe the existing noise environment, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels and is necessary to assess potential cumulative noise impacts.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (Leq). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (8:00 a.m. to 10:00 p.m.) and nighttime (10:01 p.m. to 7:59 a.m.) noise levels at each noise level measurement location. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

EXHIBIT 5-A: NOISE MEASUREMENT LOCATIONS

- Location L1 represents the noise levels at the northeastern corner of Ironwood Avenue and Nason Street near existing residential homes across Ironwood Avenue. The noise level measurements collected show an overall 24-hour exterior noise level of 63.6 dBA CNEL. The hourly noise levels measured at location L1 ranged from 55.5 to 61.9 dBA Leq during the daytime hours and from 45.3 to 62.8 dBA Leq during the nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 60.1 dBA Leq with an average nighttime noise level of 57.1 dBA Leq.
- Location L2 represents the noise levels in the northwestern portion of the Project site, east of existing residential homes across Nason Street. The noise level measurements collected show an overall 24-hour exterior noise level of 55.4 dBA CNEL. The hourly noise levels measured at location L2 ranged from 45.4 to 50.2 dBA Leq during the daytime hours and from 44.2 to 52.8 dBA Leq during the nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 48.7 dBA Leq with an average nighttime noise level of 49.0 dBA Leq.
- Location L3 represents the noise levels at the southwestern corner of Ironwood Avenue and Oliver Street adjacent to an existing residential home. The 24-hour CNEL indicates that the overall exterior noise level is 63.0 dBA CNEL. At location L3 the background ambient noise levels ranged from 56.2 to 61.9 dBA Leq during the daytime hours to levels of 46.8 to 61.0 dBA Leq during the nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 59.7 dBA Leq with an average nighttime noise level of 56.1 dBA Leq.
- Located on the eastern Project site boundary, location L4 represents the noise levels north of Ironwood Avenue at the Project site. The noise level measurements collected show an overall 24-hour exterior noise level of 55.5 dBA CNEL. The hourly noise levels measured at location L4 ranged from 46.7 to 51.2 dBA Leq during the daytime hours and from 43.6 to 53.2 dBA Leq during the nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 49.7 dBA Leq with an average nighttime noise level of 49.1 dBA Leq.
- Location L5 represents the noise levels south of the Project site across Ironwood Avenue adjacent to existing residential homes. The 24-hour CNEL indicates that the overall exterior noise level is 73.2 dBA CNEL. At location L5 the background ambient noise levels ranged from 66.7 to 71.6 dBA Leq during the daytime hours to levels of 58.2 to 72.2 dBA Leq during the nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 69.9 dBA Leq with an average nighttime noise level of 66.8 dBA Leq.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides a summary of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

The background ambient noise levels in the Project study area are dominated by the transportation related noise associated with the arterial roadway network. This includes the auto and heavy truck activities near the noise level measurement locations. The 24-hour existing noise level measurements shown on Table 5-1 present the worst-case existing unmitigated ambient noise conditions.

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Distance from Project Site (Feet)	Description	Hourly Noise Level (dBA Leq)[2]		CNEL
			Daytime	Nighttime	
L1	0'	Located at the northeastern corner of Ironwood Avenue and Nason Street near existing residential homes across Ironwood Avenue.	60.1	57.1	63.6
L2	0'	Located in the northwestern portion of the Project site, east of existing residential homes across Nason Street.	48.7	49.0	55.4
L3	96'	Located at the southwestern corner of Ironwood Avenue and Oliver Street adjacent to an existing residential home.	59.7	56.1	63.0
L4	0'	Located north of Ironwood Avenue on the eastern Project site boundary.	49.7	49.1	55.5
L5	81'	Located south of the Project site across Ironwood Avenue adjacent to existing residential homes.	69.9	66.8	73.2

[1] See Exhibit 5-A for the location of the noise level measurement locations.
[2] Energy (logarithmic) average hourly levels. The long-term 24-hour measurement printouts are included in Appendix 5.2.
"Daytime" = 8:00 a.m. to 10:00 p.m.; "Nighttime" = 10:01 p.m. to 7:59 a.m.

6 METHODS AND PROCEDURES

The following section outlines the methods and procedures used to model and analyze the future traffic noise environment.

6.1 FHWA Traffic Noise Prediction Model

The estimated roadway noise impacts from vehicular traffic were calculated using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (14) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (15) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period.

6.2 Off-Site Traffic Noise Prediction Model Inputs

Table 6-1 presents the roadway parameters used to assess the Project's off-site transportation noise impacts. Table 6-1 identifies the nine study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications according to the City of Moreno Valley General Plan Environmental Impact Report (EIR) Traffic/Circulation section, and the vehicle speeds. The ADT volumes used for this study, presented in Table 6-2, were obtained from the *Ironwood Residential (TTM No. 37001) Traffic Impact Analysis,* prepared by Urban Crossroads, Inc. (1) Table 6-3 presents the time of day vehicle splits and Table 6-4 presents the traffic flow distributions (vehicle mix) used for this analysis. The vehicle mix provides the hourly distribution percentages of automobile, medium trucks and heavy trucks for input into the FHWA noise prediction model.

TABLE 6-1: OFF-SITE ROADWAY PARAMETERS

ID	Roadway	Segment	Adjacent Planned Land Use[1]	Distance from Centerline to Nearest Adjacent Land Use (feet)[2]	Vehicle Speed (mph)
1	Nason St.	s/o Ironwood Av.	Residential	44'	45

6.3 ON-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

The on-site roadway parameters including the ADT volumes used for this analysis are presented on Table 6-5. Based on the City of Moreno Valley General Plan EIR Traffic/Circulation section, Figure 5.2-1, Ironwood Avenue is classified as a 4-lane Minor Arterial. (16) To predict the future on-site noise environment at the Project site, the City of Moreno Valley General Plan EIR Traffic/Circulation section, Table 5.2-5, future design capacity traffic volumes were used. The traffic volumes shown on Table 6-5 reflect future long-range traffic conditions needed to assess the future on-site traffic noise environment and to identify potential mitigation measures (if any) that address the worst-case future conditions. For the purposes of this analysis, soft site conditions were used to analyze the on-site traffic noise impacts for the Project study area. Soft site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation.

TABLE 6-5: ON-SITE ROADWAY PARAMETERS

Roadway	Lanes	Classification[1]	Design Capacity Volume[2]	Posted Speed Limit (mph)[3]	Site Conditions
Ironwood Av.	4	Minor Arterial	30,000	55	Soft

[1] Road classifications based upon the City of Moreno Valley General Plan Environmental Impact Report (EIR), Figure 5.2-1.

[3] Source: Ironwood Residential (TTM No. 37001) Traffic Impact Analysis, Urban Crossroads, Inc., August 2015.

Table 6-3 presents the time of day vehicle splits by vehicle type, and Table 6-4 presents the total traffic flow distributions (vehicle mixes) used for this analysis. The vehicle mix provides the hourly distribution percentages of automobile, medium trucks and heavy trucks for input into the FHWA model based on roadway types. To predict the future noise environment at lots within the Project site, coordinate information was collected to identify the noise transmission path between the noise source and receiver. The coordinate information is based on the Project site plan showing the plotting of each lot in relationship to Ironwood Avenue, as shown in Appendix 6.1.

The site plan is used to identify the relationship between the roadway centerline elevation, the pad elevation and the centerline distance to the noise barrier, and the building façade. The exterior noise level impacts at the outdoor living area receivers (backyards) were placed five feet above the pad elevation and ten feet from the proposed barrier location or at the proposed building façade, whichever is greater. First floor receivers were located five feet above the proposed finished floor elevation and second floor receivers were located fourteen feet above the proposed finished floor elevation.

6.4 VIBRATION ASSESSMENT

This analysis focuses on the potential ground-borne vibration associated with vehicular traffic and construction activities. Ground-borne vibration levels from automobile traffic are generally overshadowed by vibration generated by heavy trucks that roll over the same uneven roadway surfaces. However, due to the rapid drop-off rate of ground-borne vibration and the short duration of the associated events, vehicular traffic-induced ground-borne vibration is rarely perceptible beyond the roadway right-of-way, and rarely results in vibration levels that cause damage to buildings in the vicinity.

However, while vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Ground vibration levels associated with various types of construction equipment are summarized on Table 6-6. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the human response (annoyance) using the following vibration assessment methods defined by the FTA. To describe the human response (annoyance) associated with vibration impacts the FTA provides the following equation (7): $L_{VdB}(D) = L_{VdB}(25\text{ ft}) - 30\log(D/25)$

TABLE 6-6: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	Vibration Decibels (VdB) at 25 feet
Small bulldozer	58
Jackhammer	79
Loaded Trucks	86
Large bulldozer	87

7 OFF-SITE TRAFFIC NOISE IMPACTS

To assess the off-site transportation CNEL noise level impacts associated with development of the proposed Project, noise contours were developed based on the *Ironwood Residential (TTM No. 37001) Traffic Impact Analysis*. (1) Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise contours were developed for the following traffic scenarios:

- <u>Existing Without / With Project</u>: This scenario refers to the existing present-day noise conditions, without the Project, and with the construction of the Project.
- <u>Year 2020 Without / With Project</u>: This scenario refers to the background noise conditions at future Year 2020 with and without the proposed Project. The with Project scenario corresponds to Year 2020 conditions and includes all cumulative projects identified in the Traffic Impact Analysis.
- <u>Year 2035 Without / With Project</u>: This scenario refers to the background noise conditions at future Year 2035 with and without the proposed Project. The with Project scenario corresponds to Year 2035 conditions and includes all cumulative projects identified in the Traffic Impact Analysis.

7.1 TRAFFIC NOISE CONTOURS

To quantify the Project's traffic noise impacts on the surrounding areas, the changes in traffic noise levels on nine roadway segments surrounding the Project were calculated based on the changes in the average daily traffic volumes. The noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. Based on the noise impact significance criteria described in Section 4, a significant off-site traffic noise level impact occurs if the without Project noise levels at nearby noise-sensitive receivers:

- are less than 60 dBA and the Project creates a *readily perceptible* 5 dBA or greater Project related noise level increase, or:
- range from 60 to 65 dBA and the Project creates a *barely perceptible* 3 dBA or greater Project noise level increase, or;
- already exceed 65 dBA, and the Project creates a community noise level impact of greater than 1.5 dBA.

Noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not take into account the effect of any existing noise barriers or topography that may affect ambient noise levels. In addition, since the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from any nearby stationary noise sources within the Project study area. Tables 7-1 to 7-6 present a summary of the unmitigated exterior traffic noise levels for the nine study area roadway segments analyzed from the without Project to the with Project conditions in each of the three timeframes: Existing, Year 2020, and

Year 2035 conditions. Appendix 7.1 includes a summary of the traffic noise level contours for each of the six traffic scenarios.

7.2 EXISTING CONDITION PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-7 presents a comparison of the Existing without and with Project conditions CNEL noise levels. Table 7-1 shows that the exterior noise levels are expected to range from 64.9 to 71.0 dBA CNEL for Existing without Project conditions. Table 7-2 presents the Existing with Project conditions noise level contours that are expected to range from 65.8 to 71.1 dBA CNEL. As shown on Table 7-7 the Project is expected to generate an exterior noise level increase of up to 0.9 dBA CNEL. Based on the significance criteria in Section 4, the Project-related off-site traffic noise level increases are considered *less than significant* impacts for all roadway segments under Existing conditions.

TABLE 7-7: EXISTING PROJECT-RELATED TRAFFIC NOISE IMPACTS

ID	Road	Segment	Adjacent Land Use[1]	CNEL at Adjacent Land Use (dBA)			Potential Significant Impact?[2]

7.3 YEAR 2020 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-8 presents a comparison of the Year 2020 without and with Project conditions CNEL noise levels. Table 7-3 shows that the exterior noise levels are expected to range from 68.1 to 72.5 dBA CNEL for Year 2020 without Project conditions. Table 7-4 presents the Year 2020 with Project conditions noise level contours that are expected to range from 68.5 to 72.5 dBA CNEL. As shown on Table 7-8 the Project is expected to generate an exterior noise level increase of up to 0.5 dBA CNEL. Based on the significance criteria in Section 4, the Project-related off-site traffic noise level increases are considered *less than significant* impacts for all roadway segments under Year 2020 conditions.

TABLE 7-8: YEAR 2020 PROJECT-RELATED TRAFFIC NOISE IMPACTS

ID	Road	Segment	Adjacent Land Use[1]	CNEL at Adjacent Land Use (dBA)			Potential Significant Impact?[2]

7.4 YEAR 2035 PROJECT TRAFFIC NOISE LEVELS

Table 7-9 presents a comparison of the Year 2035 without and with Project conditions CNEL noise levels. Table 7-5 shows that the exterior noise levels are expected to range from 68.5 to 72.9 dBA CNEL for Year 2035 without Project conditions. Table 7-6 presents the Year 2035 with Project conditions noise level contours that are expected to range from 68.9 to 72.9 dBA CNEL. As shown on Table 7-9 the Project is expected to generate an exterior noise level increase of up to 0.4 dBA CNEL. Based on the significance criteria in Section 4, the Project-related off-site traffic noise level increases are considered *less than significant* impacts for all roadway segments under Year 2035 conditions.

TABLE 7-9: YEAR 2035 PROJECT-RELATED TRAFFIC NOISE IMPACTS

[2] Significance Criteria (Section 4, Table 4-1).

7.5 PROJECT TRAFFIC NOISE CONTRIBUTIONS

The off-site traffic noise analysis shows that the greatest Project-related noise level contribution of 0.9 dBA CNEL under Existing conditions will decrease to 0.4 dBA CNEL under Year 2035 conditions. This shows that the Project's incremental traffic-related noise level increases at land uses adjacent to roadways conveying Project traffic will diminish over time. This occurs as the background traffic on the study area roadway segments increases and the Project represents a smaller percentage of the overall traffic volume. The off-site traffic noise analysis indicates that the Project’s contributions to roadway noise levels will be *less than significant*.

This page intentionally left blank

8 ON-SITE TRAFFIC NOISE IMPACTS

An on-site exterior noise impact analysis has been completed to determine the traffic noise exposure and to identify potential necessary noise abatement measures for the proposed Ironwood Residential (TTM No. 37001) Project. It is expected that the primary source of noise impacts to the Project site will be traffic noise from Ironwood Avenue. The Project will also experience some background traffic noise impacts from Nason Street, Oliver Street, and the Project's internal streets, however, due to the distance, topography and low traffic volume/speed, traffic noise from these roads will not make a significant contribution to the noise environment.

8.1 ON-SITE EXTERIOR NOISE ANALYSIS

Using the FHWA traffic noise prediction model and the parameters outlined in Tables 6-3 to 6-5, the expected future exterior noise levels for individual lots were calculated. Table 8-1 presents a summary of future exterior noise level impacts in the outdoor living areas (backyards) for the lots within the Project site. The on-site traffic noise level impacts indicate that the lots adjacent to Ironwood Avenue will experience unmitigated exterior noise levels ranging from 63.3 to 67.0 dBA CNEL. The on-site traffic noise analysis calculations are provided in Appendix 8.1.

To satisfy the City of Moreno Valley 65 dBA CNEL exterior noise level standards for residential land use, the construction of 4-foot high noise barriers for the outdoor living areas (backyards) of lots 26 to 30 is required. With the recommended noise barriers shown on Exhibit ES-A, the mitigated future exterior noise levels will range from 61.5 to 63.3 dBA CNEL. This noise analysis shows that the recommended noise barriers will satisfy the City of Moreno Valley 65 dBA CNEL exterior noise level standards. The recommendations identify the minimum required noise barrier height to satisfy the City of Moreno Valley exterior noise level standards.

TABLE 8-1: EXTERIOR NOISE LEVELS (CNEL)

Lot Number	Roadway	Unmitigated Noise Level (dBA CNEL)	Mitigated Noise Level (dBA CNEL)	Recommended Barrier Height (Feet)	Top of Barrier Elevation (Feet)

30	Ironwood Av.	67.0	61.6	4'	1882'

[1] No exterior noise mitigation required to meet the City of Moreno Valley exterior noise standards.

8.2 On-Site Interior Noise Analysis

To ensure that the interior noise levels comply with the City of Moreno Valley 45 dBA CNEL interior noise standards, future noise levels were calculated at the first and second floor building façades.

8.2.1 Noise Reduction Methodology

The interior noise level is the difference between the predicted exterior noise level at the building façade and the noise reduction of the structure. Typical building construction will provide a Noise Reduction (NR) of approximately 12 dBA with "windows open" and a minimum 25 dBA NR with "windows closed." However, sound leaks, cracks and openings within the window assembly can greatly diminish its effectiveness in reducing noise. Several methods are used to improve interior NR, including: (1) weather-stripped solid core exterior doors; (2) upgraded dual glazed windows; (3) mechanical ventilation/air conditioning; and (4) exterior wall/roof assembles free of cut outs or openings.

8.2.2 Interior Noise Level Assessment

To satisfy the City of Moreno Valley 45 dBA CNEL interior noise level criteria, a Noise Reduction (NR) of up to 21.4 dBA and a windows closed condition requiring a means of mechanical ventilation (e.g. air conditioning) are required for lots adjacent to Ironwood Avenue. Table 8-2 shows that the future unmitigated noise levels at the first floor building façade are expected to range from 60.1 to 64.3 dBA CNEL. The first floor interior noise level analysis shows that the City of Moreno Valley 45 dBA CNEL interior noise level standards for residential land use can be satisfied using standard windows with a minimum STC rating of 27 for all lots adjacent to Ironwood Avenue. Table 8-3 shows that the future unmitigated noise levels at the second floor building façade are expected to range from 63.0 to 66.4 dBA CNEL. The second floor interior noise level analysis shows that the City of Moreno Valley 45 dBA CNEL interior noise level standards for residential land use can be satisfied using standard windows with a minimum STC rating of 27 for all lots adjacent to Ironwood Avenue. The interior noise analysis shows that with the recommended interior noise mitigation measures described in the Executive Summary, the Project will satisfy the City of Moreno Valley 45 dBA CNEL interior noise level standards for residential development.

TABLE 8-2: FIRST FLOOR INTERIOR NOISE IMPACTS (CNEL)

Lot Number	Noise Level at Façade[1]	Required Interior Noise Reduction[2]	Estimated Interior Noise Reduction[3]	Upgraded Windows[4]	Interior Noise Level[5]
1	64.1	19.1	25.0	No	39.1

9 RECEIVER LOCATIONS

To assess the potential for short-term construction noise impacts, the following nine receiver locations, as shown on Exhibit 9-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include: schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include: multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, natural open space, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

Representative sensitive receivers in the vicinity of the Project site include existing residential homes represented by receiver locations R1 to R9. The closest sensitive receiver is represented by location R1 where an existing residential home is located approximately 40 feet west of the Project site.

R1: Located approximately 40 feet west of the Project site, R1 represents existing residential homes at the northwest corner of Nason Street and Sandi Lane.

R2: Location R2 represents the existing single-family residential home located approximately 86 feet west of the Project site across Nason Street.

R3: Location R3 represents the existing residential homes situated west of the Project site across Nason Street at a distance of roughly 208 feet.

R4: Location R4 represents the existing residential home situated approximately 168 feet south of the Project site across Ironwood Avenue.

R5: At a distance of approximately 141 feet, location R5 represents single-family residential homes south of the Project site across Ironwood Avenue.

R6: At a distance of 145 feet south of the Project site, R6 describes the residential homes located at the southwest corner of Ironwood Avenue and Lantz Lane.

R7: Location R7 represents existing single-family residential homes located south of the Project site at a distance of approximately 227 feet on Walfred Way.

R8: Location R8 represents the existing residential home situated approximately 216 feet south of the Project site at the northwest corner of Walfred Way and Oliver Street.

R9: Location R9 represents the existing residential community located approximately 1,369 feet east of the Project site.

EXHIBIT 9-A: RECEIVER LOCATIONS

10 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project.

10.1 CONSTRUCTION NOISE STANDARDS

Project construction shall be limited to the hours of 7:00 a.m. to 8:00 p.m. on any day and may not generate a noise level at 200 feet from the property line which exceeds the noise standards provided in the Noise Ordinance, Section 11.80.030(C), *Non-impulsive Sound Decibel Limits*, which states the following:

> *No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any non-impulsive sound which exceeds the limits set forth for the source land use category in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance*. (10)

Even though the City of Moreno Valley Municipal Code does not identify specific construction noise limits; it does provide noise level limits for the source land use category when measured at a distance of 200 feet. For the purpose of this analysis, the Ironwood Residential (TTM No. 37001) Project is considered *Residential* land use since it is *land primarily for dwelling units*, as defined by the City of Moreno Valley Municipal Code. For residential land uses, the City of Moreno Valley 60 dBA Leq noise level standard at a distance of 200 feet is used as the limit for this analysis to assess the construction noise level impacts at sensitive receivers in the Project study area. Therefore, to conform to the applicable provisions of the Municipal Code, the maximum allowable noise generated by on-site construction activities when measured at 200 feet from any property line, shall not exceed 60 dBA Leq.

10.2 CONSTRUCTION NOISE LEVELS

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers and portable generators that when combined can reach high levels. The number and mix of construction equipment is expected to occur in the following four stages:

- Grading
- Paving
- Building Construction
- Architectural Coating

This construction noise analysis was prepared using the Federal Highway Administration (FHWA) published Roadway Construction Noise Model (RCNM) that includes a national database of construction equipment reference noise emission levels. (17) The RCNM equipment database, as shown in Appendix 10.1, provides a comprehensive list of the noise generating characteristics for specific types of construction equipment. In addition, the database provides an acoustical usage factor to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation.

Noise levels generated by heavy construction equipment can range from approximately 62 dBA to 76 dBA when measured at 200 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 76 dBA measured at 200 feet from the noise source to the receiver would be reduced to 70 dBA at 400 feet from the source to the receiver, and would be further reduced to 64 dBA at 800 feet from the source to the receiver. The construction noise levels including the number and mix of construction equipment by construction phase are consistent with the data used to support the construction emissions in the *Ironwood Residential (TTM No. 37001) Air Quality Impact Analysis* prepared by Urban Crossroads Inc. (18)

10.3 Construction Noise Analysis

Using the stationary-source RCNM noise prediction model, calculations of the Project construction noise level impacts at the nine sensitive receiver locations were completed. Tables 10-1 to 10-4 present the short-term construction noise levels at a distance of 200 feet from the center of construction activity for each stage of construction. Table 10-5 provides a summary of the construction noise levels by phase at the nine noise receiver locations. Based on the four stages of construction, the noise impacts associated with the proposed Project are expected to create temporary high noise levels at the nearby receiver locations. To assess the construction noise levels at each receiver location, this analysis shows the construction noise levels by phase when all heavy equipment is operating simultaneously at a distance of roughly 100 feet from the Project site boundary. Exhibit 10-A shows the receiver locations and construction activity location used in this analysis.

10.4 CONSTRUCTION NOISE THRESHOLDS OF SIGNIFICANCE

The construction noise analysis shows that the highest construction noise levels will occur during grading activities within the Project site. As shown on Table 10-5, the unmitigated peak construction noise levels are expected to range from 46.2 to 66.6 dBA Leq. Construction activities are estimated to occur during the permitted hours of 7:00 a.m. to 8:00 p.m. on any day, based on the City of Moreno Valley Municipal Code. (10)

TABLE 10-5: UNMITIGATED CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Noise Receiver[1]	Distance To Construction Activity (Feet)	Construction Phase Hourly Noise Level (dBA Leq)					Potential Significant Impact?[3]
		Grading	Paving	Building Const.	Arch. Coating	Peak[2]	
R1	140'	66.6	59.9	62.2	53.0	66.6	Yes
R2	186'	64.1	57.4	59.7	50.6	64.1	Yes
R3	308'	59.7	53.0	55.3	46.2	59.7	No
R4	269'	60.9	54.2	56.5	47.4	60.9	Yes
R5	241'	56.9	50.2	52.5	43.3	56.9	No
R6	245'	61.7	55.0	57.3	48.2	61.7	Yes
R7	327'	59.2	52.5	54.8	45.7	59.2	No
R8	316'	54.5	47.8	50.1	41.0	54.5	No
R9	1,469'	46.2	39.5	41.8	32.6	46.2	No

[1] Noise receiver locations are shown on Exhibit 10-A.
[2] Estimated construction noise levels during peak operating conditions.
[3] Do the peak construction noise levels exceed the City of Moreno Valley 60 dBA Leq threshold?

Based on the construction noise standards described in Section 3.4, the potential short-term unmitigated construction noise level impacts are expected to exceed the acceptable construction noise level threshold of 60 dBA Leq at nearby sensitive receiver locations R1, R2, R4, and R6 during the permitted hours of construction activity. Therefore, temporary noise abatement would be needed to reduce the potential construction noise impacts. With the installation of temporary exterior noise control barriers providing a minimum attenuation of 10 dBA, construction noise levels at the nearby residential receivers would be reduced, but not eliminated.

This analysis does not evaluate the feasibility of temporary noise barrier installation. If it is not feasible to install temporary barriers, construction noise levels would not be reduced, because no other measures exist to reasonably reduce construction noise levels. The noise attenuation provided through temporary noise barriers depends on many factors including cost, wind loading, the location of the receiver, and the ability to place barriers such that the line-of-sight of the receiver is blocked to the noise source, among others. This analysis assumes a temporary noise barrier capable of 10 dBA of attenuation and constructed using frame-mounted materials such as vinyl acoustic curtains or quilted blankets.

While noise attenuation of greater than 10 dBA may be possible to achieve with the use of temporary barriers, the noise barrier costs are expected to increase exponentially in relation to additional attenuation provided above 10 dBA. This suggests a point of diminishing return of noise attenuation for temporary noise barriers beyond 10 dBA. While a 10 dBA reduction in sound level is considered *attainable*, a reduction of 15 dBA is *very difficult* and a 20 dBA reduction is *nearly impossible*. (4) Further noise attenuation strategies include the installation of temporary barriers or window inserts and treatments at each receiver location to reduce the noise levels and block the line of sight to the source. However, the ability to install such measures at the approval of nearby homeowners may not be feasible and will vary depending on each homeowner's willingness to allow for installation. Further, noise abatement at the receiver is usually only cost-effective if fewer residences are involved as each home may require different materials based on each home's specifications. (19) Therefore, an *attainable* attenuation of 10 dBA through the use of temporary construction noise barriers is recommended to reduce construction noise levels at the nearby residential receivers.

Table 10-6 shows the peak construction noise levels are expected to range from 46.2 to 56.6 dBA Leq with the attenuation provided by the temporary construction noise barriers. With the temporary noise control barrier providing a minimum attenuation of 10 dBA, the construction noise levels will satisfy the 60 dBA Leq construction noise level threshold. Therefore, the construction of the Project will result in a *less than significant* noise impact with mitigation at nearby receiver locations during peak construction activity.

TABLE 10-6: MITIGATED CONSTRUCTION EQUIPMENT NOISE LEVEL SUMMARY

Noise Receiver[1]	Distance To Const. Activity (Feet)	Without Temporary Noise Barriers			With Temporary Noise Barriers		
		Const. Noise Level (dBA Leq)[2]	Threshold (dBA Leq)[3]	Compliance[4]	Attenuation	Const. Noise Levels With Attenuation[5]	Compliance With Attenuation[4]

[4] Do the estimated Project construction noise levels meet the threshold of 60 dBA Leq?
[5] Peak construction noise levels with the recommended minimum temporary noise barrier attenuation of 10 dBA when operating near sensitive receiver locations.

10.5 CONSTRUCTION NOISE MITIGATION MEASURES

Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following practices would reduce any noise level increases produced by the construction equipment to the nearby noise-sensitive residential land uses:

- Prior to approval of grading plans and/or issuance of building permits, plans shall include a note indicating that noise-generating Project construction activities shall only occur between the hours of 7:00 a.m. and 8:00 p.m. on any day. The Project construction supervisor shall ensure compliance with the note and the City shall conduct periodic inspection at its discretion.

- Install temporary noise control barriers that provide a minimum noise level attenuation of 10 dBA when Project construction occurs near existing noise-sensitive structures. The noise control barrier must present a solid face from top to bottom. The noise control barrier must be high enough and long enough to block the view of the noise source. Unnecessary openings shall not be made.
  - The noise barrier may be constructed using an acoustical blanket (e.g. vinyl acoustic curtains or quilted blankets) attached to the construction site perimeter fence or equivalent temporary fence posts.
  - The noise barriers must be maintained and any damage promptly repaired. Gaps, holes, or weaknesses in the barrier or openings between the barrier and the ground shall be promptly repaired.
  - The noise control barriers and associated elements shall be completely removed and the site appropriately restored upon the conclusion of the construction activity.
- During all Project site construction, the construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. The construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receivers nearest the Project site (i.e., to the northern center) during all Project construction.
- The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment (between the hours of 7:00 a.m. and 8:00 p.m. on any day). The contractor shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.

10.6 Construction Vibration Impacts

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

- Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to building, the vibration is usually short-term and is not of sufficient magnitude to cause building damage. It is not expected that heavy equipment such as large bulldozers would operate close enough to any residences to cause a vibration impact.
- Trucks: Trucks hauling building materials to construction sites can be sources of vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

Ground-borne vibration levels resulting from construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration. Construction activities that would have the potential to generate low levels of ground-borne vibration within the Project site include grading. Using the vibration source level of construction equipment provided on Table 6-6 and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. Table 10-7 presents the expected Project related vibration levels at each of the nine sensitive receiver locations.

TABLE 10-7: CONSTRUCTION EQUIPMENT VIBRATION LEVELS

Noise Receiver[1]	Distance To Construction Activity (Feet)	Receiver Vibration Levels (VdB)[2]					Potential Significant Impact?[3]
		Small Bulldozer	Jackhammer	Loaded Trucks	Large Bulldozer	Peak Vibration	
R1	140'	35.6	56.6	63.6	64.6	64.6	No
R2	186'	31.9	52.9	59.9	60.9	60.9	No
R3	308'	25.3	46.3	53.3	54.3	54.3	No
R4	269'	27.0	48.0	55.0	56.0	56.0	No
R5	241'	28.5	49.5	56.5	57.5	57.5	No
R6	245'	28.3	49.3	56.3	57.3	57.3	No
R7	327'	24.5	45.5	52.5	53.5	53.5	No
R8	316'	24.9	45.9	52.9	53.9	53.9	No
R9	1,469'	4.9	25.9	32.9	33.9	33.9	No

[1] Noise receiver locations are shown on Exhibit 10-A.
[2] Based on the Vibration Source Levels of Construction Equipment included on Table 6-6.
[3] Does the Peak Vibration exceed the FTA maximum acceptable vibration standard of 80 (VdB)?

Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference velocity of 87 VdB at a distance of 25 feet. At distances ranging from 140 to 1,469 feet from the Project site, construction vibration velocity levels are expected to approach 64.6 VdB, as shown on Table 10-7. Based on the FTA vibration standards, the proposed Project site will not include or require equipment, facilities, or activities that would result in a *barely perceptible* human response (annoyance) for infrequent events.

Further, vibration levels at the site of the closest sensitive receiver are unlikely to be sustained during the entire construction period, but will occur rather only during the times that heavy construction equipment is operating simultaneously at a distance of 100 feet from the Project site perimeter. Moreover, construction at the Project site will be restricted to daytime hours consistent with City requirements thereby eliminating potential vibration impacts during the sensitive nighttime hours. The results of this analysis indicate that the vibration impacts due to Project construction will be *less than significant*.

12 CERTIFICATION

The contents of this noise study report represent an accurate depiction of the noise environment and impacts associated with the proposed Ironwood Residential (TTM No. 37001) Project. The information contained in this noise study report is based on the best available data at the time of preparation. If you have any questions, please contact me directly at (949) 660-1994 ext. 203.

APPENDIX 3.1:

CITY OF MORENO VALLEY MUNICIPAL CODE

This page intentionally left blank

Chapter 11.80 NOISE REGULATION

11.80.010 Legislative findings.

It is found and declared that:

A. Excessive sound within the limits of the city is a condition which has existed for some time, and the amount and intensity of such sound is increasing.

B. Such excessive sound is a detriment to the public health, safety, and welfare and quality of life of the residents of the city.

C. The necessity in the public interest for the provisions and prohibitions hereinafter contained and enacted is declared as a matter of legislative determination and public policy, and it is further declared that the provisions and prohibitions hereinafter contained and enacted are in pursuance of and for the purpose of securing and promoting the public health, safety, welfare and quality of life of the city and its inhabitants. (Ord. 740 § 1.2, 2007)

11.80.020 Definitions.

For purposes of this chapter, certain words and phrases used herein are defined as follows:

"A-weighted sound level" means the sound pressure level in decibels as measured with a sound level meter using the A-weighting network. The unit of measurement is the dB(A).

"Commercial" means all uses of land not otherwise classified as residential, as defined in this section.

"Construction" means any site preparation, and/or any assembly, erection, repair, or alteration, excluding demolition, of any structure, or improvements to real property.

"Continuous airborne sound" means sound that is measured by the slow-response setting of a meter manufactured to the specifications of ANSI Section 1.4-1983 (R2006) "Specification for Sound Level Meters," or its successor.

"Daytime" means eight a.m. to ten p.m. the same day.

"Decibel" (dB) means a unit for measuring the amplitude of sound, equal to twenty (20) times the logarithm to the base ten (10) of the ratio of the pressure of the sound measured to the reference pressure, which is twenty (20) microPascals (twenty (20) microNewtons per square meter.)

"Demolition" means any dismantling, intentional destruction or removal of structures or other improvements to real property.

"Disturb" means to interrupt, interfere with, or hinder the enjoyment of peace or quiet or the normal listening activities or the sleep, rest or mental concentration of the hearer.

"Emergency" means any occurrence or set of circumstances involving actual or imminent physical trauma or significant property damage which necessitates immediate action. Economic loss alone shall not constitute an emergency. It shall be the burden of an alleged violator to prove an "emergency."

"Emergency work" means any work made necessary to restore property to a safe condition following an emergency, or to protect persons or property threatened by an imminent emergency, to the extent such work is, in fact, necessary to protect persons or property from exposure to imminent danger or damage.

"Frequency" means the number of complete oscillation cycles per unit of time.

"Impulsive sound" means sound of short duration, usually less than one second, with an abrupt onset and rapid decay. Examples of sources of impulsive sound include explosions, drop forge impacts, and discharge of firearms.

"Nighttime" means 10:01 p.m. to 7:59 a.m. the following day.

"Noise disturbance" means any sound which:

1. Disturbs a reasonable person of normal sensitivities;

2. Exceeds the sound level limits set forth in this chapter; or

3. Is plainly audible as defined in this section. Where no specific distance is set forth for the determination of audibility, references to noise disturbance shall be deemed to mean plainly audible at a distance of two hundred (200) feet from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right of way, public space or other publicly owned property.

"Person" means any person, person's firm, association, copartnership, joint venture, corporation, or any entity public or private in nature.

"Plainly audible" means that the sound or noise produced or reproduced by any particular source, can be clearly distinguished from ambient noise by a person using his/her normal hearing faculties.

"Public right-of-way" means any street, avenue, boulevard, sidewalk, bike path or alley, or similar place normally accessible to the public which is owned or controlled by a governmental entity.

"Public space" means any park, recreational or community facility, or lot which contains at least one building that is open to the general public during its hours of operation.

"Residential" means all uses of land primarily for dwelling units, as well as hospitals, schools, colleges and universities, and places of religious assembly.

"Sound" means an oscillation in pressure, particle displacement, particle velocity or other physical parameter, in a medium with internal forces that causes compression and rarefaction of that medium capable of producing an auditory impression. The description of sound may include any characteristic of such sound, including duration, intensity and frequency.

"Sound level" means the weighted sound pressure level as measured in dB(A) by a sound level meter and as specified in American National Standards Institute (ANSI) specifications for sound-level meters (ANSI Section 1.4-1971 (R1976)). If the frequency weighting employed is not indicated, the A-weighting shall apply.

"Sound level meter" means an instrument, demonstrably capable of accurately measuring sound levels as defined above.

All technical definitions not defined above shall be in accordance with applicable publications and standards of the American National Standards Institute (ANSI). (Ord. 740 § 1.2, 2007)

11.80.030 Prohibited acts.

A. General Prohibition. It is unlawful and a violation of this chapter to maintain, make, cause, or allow the making of any sound that causes a noise disturbance, as defined in Section 11.80.020.

B. Sound causing permanent hearing loss.

1. Sound level limits. Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 and Table 1-A specify sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the sound levels are being exceeded. No sound shall be permitted within the city which exceeds the parameters set forth in Tables 11.80.030-1 and 11.80.030-1-A of this chapter:

Table 11.80.030-1

MAXIMUM CONTINUOUS SOUND LEVELS*

Duration per Day Continuous Hours	Sound level [db(A)]
8	90
6	92
4	95
3	97
2	100
1.5	102
1	105
0.5	110
0.25	115

* When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percent of allowed period of sound exposure at each level exceeds 100 percent

Table 11.80.030-1A

MAXIMUM IMPULSIVE SOUND LEVELS

Number of Repetitions per 24-Hour Period	Sound level [dB(A)]
1	145
10	135
100	125

2. Exemptions. No violation shall exist if the only persons exposed to sound levels in excess of those listed in Tables 11.80.030-1 and 11.80.030-1A are exposed as a result of:

a. Trespass;

b. Invitation upon private property by the person causing or permitting the sound; or

c. Employment by the person or a contractor of the person causing or permitting the sound.

C. Nonimpulsive Sound Decibel Limits. No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimplusive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.

Table 11.80.030-2

MAXIMUM SOUND LEVELS (IN dB(A)) FOR SOURCE LAND USES

Residential		Commercial	
Daytime	Nighttime	Daytime	Nighttime
60	55	65	60

D. Specific Prohibitions. In addition to the general prohibitions set out in subsection A of this section, and unless otherwise exempted by this chapter, the following specific acts, or the causing or permitting thereof, are regulated as follows:

1. Motor Vehicles. No person shall operate or cause to be operated a public or private motor vehicle, or combination of vehicles towed by a motor vehicle, that creates a sound exceeding the sound level limits in Table 11.80.030-2 when the vehicle(s) are not otherwise subject to noise regulations provided for by the California Vehicle Code.

2. Radios, Televisions, Electronic Audio Equipment, Musical Instruments or Similar Devices from a Stationary Source. No person shall operate, play or permit the operation or playing of any radio, tape player, television, electronic audio equipment, musical instrument, sound amplifier or other mechanical or electronic sound making device that produces, reproduces or amplifies sound in such a manner as to create a noise disturbance. However, this subsection shall not apply to any use or activity exempted in subsection E of this section and any use or activity for which a special permit has been issued pursuant to Section 11.80.040.

3. Radios, Electronic Audio Equipment, or Similar Devices from a Mobile Source Such as a Motor Vehicle. Sound amplification or reproduction equipment on or in a motor vehicle is subject to regulation in accordance with the California Vehicle Code when upon the public right-of-way. When upon public space or publicly owned property other than the public right-of-way or upon private property open to the public, sound amplification or reproduction equipment shall not be operated in such a manner that it is plainly audible at a distance of fifty (50) feet in any direction from the vehicle.

4. Portable, Hand-Held Music or Sound Amplification or Reproduction Equipment. Such equipment shall not be operated on a public right-of-way, public space or other publicly owned property in such a manner as to be plainly audible at a distance of fifty (50) feet in any direction from the operator.

5. Loudspeakers and Public Address Systems.

a. Except as permitted by Section 11.80.040, no person shall operate, or permit the operation of, any loudspeaker, public address system or similar device, for any commercial purpose:

1. Which produces, reproduces or amplifies sound in such a manner as to create a noise disturbance; or

2. During nighttime hours on a public right-of-way, public space or other publicly owned property.

b. No person shall operate, or permit the operation of, any loudspeaker, public address system or similar device, for any noncommercial purpose, during nighttime hours in such a manner as to create a noise disturbance.

6. Animals. No person shall own, possess or harbor an animal or bird that howls, barks, meows, squawks, or makes other sounds that:

a. Create a noise disturbance;

b. Are of frequent or continued duration for ten (10) or more consecutive minutes and are plainly audible at a distance of fifty (50) feet from the real property line of the source of the sound; or

c. Are intermittent for a period of thirty (30) or more minutes and are plainly audible at a distance of fifty (50) feet from the real property line of the source of the sound.

7. Construction and Demolition. No person shall operate or cause the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by

public service utilities or for other work approved by the city manager or designee. This section shall not apply to the use of power tools as provided in subsection (D)(9) of this section.

8. Emergency Signaling Devices. No person shall intentionally sound or permit the sounding outdoors of any fire, burglar or civil defense alarm, siren or whistle, or similar stationary emergency signaling device, except for emergency purposes or for testing as follows:

a. Testing of a stationary emergency signaling device shall not occur between seven p.m. and seven a.m. the following day;

b. Testing of a stationary emergency signaling device shall use only the minimum cycle test time, in no case to exceed sixty (60) seconds;

c. Testing of a complete emergency signaling system, including the functioning of the signaling device and the personnel response to the signaling device, shall not occur more than once in each calendar month. Such testing shall only occur only on weekdays between seven a.m. and seven p.m. and shall be exempt from the time limit specified in subsection (D)(8)(2) of this section.

9. Power Tools. No person shall operate or permit the operation of any mechanically, electrically or gasoline motor-driven tool during nighttime hours so as to cause a noise disturbance across a residential real property boundary.

10. Pumps, Air Conditioners, Air-Handling Equipment and Other Continuously Operating Equipment. Notwithstanding the general prohibitions of subsection a of this section, no person shall operate or permit the operation of any pump, air conditioning, air-handling or other continuously operating motorized equipment in a state of disrepair or in a manner which otherwise creates a noise disturbance distinguishable from normal operating sounds.

E. Exemptions. The following uses and activities shall be exempt from the sound level regulations except the maximum sound levels provided in Tables 11.80.030-1 and 11.80.030-1A:

1. Sounds resulting from any authorized emergency vehicle when responding to an emergency call or acting in time of an emergency.

2. Sounds resulting from emergency work as defined in Section 11.80.020

3. Any aircraft operated in conformity with, or pursuant to, federal law, federal air regulations and air traffic control instruction used pursuant to and within the duly adopted federal air regulations; and any aircraft operating under technical difficulties in any kind of distress, under emergency orders of air traffic control, or being operated pursuant to and subsequent to the declaration of an emergency under federal air regulations.

4. All sounds coming from the normal operations of interstate motor and rail carriers, to the extent that local regulation of sound levels of such vehicles has been preempted by the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.) or other applicable federal laws or regulations

5. Sounds from the operation of motor vehicles, to the extent they are regulated by the California Vehicle Code.

6. Any constitutionally protected noncommercial speech or expression conducted within or upon a any public right-of-way, public space or other publicly owned property constituting an open or a designated public forum in compliance with any applicable reasonable time, place and manner restrictions on such speech or expression or otherwise pursuant to legal authority.

7. Sounds produced at otherwise lawful and permitted city-sponsored events, organized sporting events, school assemblies, school playground activities, by permitted fireworks, and by permitted parades on public right-of-way, public space or other publicly owned property.

8. An event for which a temporary use permit or special event permit has been issued under other provisions of this code, where the provisions of Section 11.80.040 are met, the permit granted expressly grants an exemption from specific standards contained in this chapter, and the permittee and all persons under the permittee's reasonable control actually comply with all conditions of such permit. Violation of any condition of

such a permit related to sound or sound equipment shall be a violation of this chapter and punishable as such.

F. Nothing in this chapter shall be construed to limit, modify or repeal any other regulation elsewhere in this code relating to the regulation of noise sources, nor shall any such other regulation be read to permit the emission of noise in violation of any provision of this chapter. (Ord. 740 § 1.2, 2007)

11.80.040 Special provisions for temporary use and special event permits.

The exemption by permit set forth in Section 11.80.030(E)(8) shall be subject to the following requirements and conditions:

A. The permit application shall include the name, address and telephone number of the permit applicant; the date, hours and location for which the permit is requested; and the nature of the event or activity. It shall also specify the types of sounds and/or sound equipment to be permitted, the proposed duration of such sound, the specific standards from which the sound is to be exempted, and the reasons for each requested exemption.

B. The permit shall be issued provided the proposed activity meets the requirements of this section and the issuing official determines that the sound to be emitted at the event as proposed would not be detrimental to the public health, safety or welfare, that the event cannot reasonably achieve its legitimate aims and purposes without the exemption and that the sound levels proposed will not unreasonably damage the peace and quiet enjoyment of the lawful users of surrounding properties, nor constitute a public nuisance.

C. The official issuing the permit may prescribe any reasonable conditions or requirements he/she deems necessary to minimize noise disturbances upon the community or the surrounding neighborhood, and/or to protect the health, safety or welfare of the public, including participants in the permitted event, including use of mufflers, screens or other sound-attenuating devices.

D. Any permit granted must be in writing and shall contain all conditions upon which the permit shall be effective.

E. No more than six events requiring a sound limit exemption may be held at any particular location upon privately owned or controlled property per calendar year, provided further that the number of events shall not exceed the number permitted under the regulations for the type of permit issued. For purposes of this subsection, "location" means a legal parcel of real property or a complete shopping or commercial center or mall sharing common parking and access even if comprised of multiple legal parcels.

F. The exemption from sound limits under such permit shall not exceed maximum period of four hours in one twenty-four (24) hour day.

G. The permit will only be granted for hours between nine a.m. and ten p.m. on all days other than Friday and Saturday; and, on Friday and Saturday, between the hours of nine a.m. and one a.m. of the following day, except in the following circumstances:

1. A permit may be granted for hours between nine a.m. on New Year's Eve and one a.m. the following day (New Year's Day).

2. A permit may be granted for hours between nine a.m. and two a.m. the following day if there are no residences, hospitals, or nursing homes within a 0.5 mile radius of the property where the function is taking place.

H. Functions for which the permits are issued shall be limited to a continuous airborne sound level not to exceed seventy (70) dB(A), as measured two hundred (200) feet from the real property boundary of the source property if on private property, or from the source if on public right of way, public space or other publicly owned property. (Ord. 740 § 1.2, 2007)

11.80.050 Measurement or assessment of sound.

A. Measurement With Sound Meter.

1. The measurement of sound shall be made with a sound level meter meeting the standards prescribed by ANSI Section 1.4-1983 (R2006). The instruments shall be maintained in calibration and good working order. A calibration check shall be made of the system at the time of any sound level measurement. Measurements recorded shall be taken so as to provide a proper representation of the source of the sound. The microphone during measurement shall be positioned so as not to create any unnatural enhancement or diminution of the measured sound. A windscreen for the microphone shall be used at all times. However, a violation of this chapter may occur without the occasion of the measurements being made as otherwise provided.

2. The slow meter response of the sound level meter shall be used in order to best determine the average amplitude.

3. The measurement shall be made at any point on the property into which the sound is being transmitted and shall be made at least three feet away from any ground, wall, floor, ceiling, roof and other plane surface.

4. In case of multiple occupancy of a property, the measurement may be made at any point inside the premises to which any complainant has right of legal private occupancy; provided that the measurement shall not be made within three feet of any ground, wall, floor, ceiling, roof or other plane surface.

5. All measurements of sound provided for in this chapter will be made by qualified officials of the city who are designated by the city manger or designee to operate the apparatus used to make the measurements.

B. Assessment Without Sound Level Meter. Any police officer, code enforcement officer, or other official designated by the city manager or designee who hears a noise or sound that is plainly audible, as defined in Section 11.80.020, in violation of this chapter, may enforce this chapter and shall assess the noise or sound according to the following standards:

1. The primary means of detection shall be by means of the official's normal hearing faculties, not artificially enhanced.

2. The official shall first attempt to have a direct line of sight and hearing to the vehicle or real property from which the sound or noise emanates so that the official can readily identify the offending source of the sound or noise and the distance involved. If the official is unable to have a direct line of sight and hearing to the vehicle or real property from which the sound or noise emanates, then the official shall confirm the source of the sound or noise by approaching the suspected vehicle or real property until the official is able to obtain a direct line of sight and hearing, and confirm the source of the sound or noise that was heard at the place of the original assessment of the sound or noise.

3. The official need not be required to identify song titles, artists, or lyrics in order to establish a violation. (Ord. 740 § 1.2, 2007)

11.80.060 Violation.

A. Violation of Sound Level Limits. Any person violating any of the provisions of this chapter shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punishable by a fine not to exceed one thousand dollars ($1,000.00) and/or six months in the county jail, or both. Notwithstanding the foregoing, any violation of the provisions of this chapter may, in the discretion of the citing officer or the city attorney, be cited and/or prosecuted as an infraction or be subject to civil citation pursuant to Chapter 1.10.

B. Joint and Several Responsibility. In addition to the person causing the offending sound, the owner, tenant or lessee of property, or a manager, overseer or agent, or any other person lawfully entitled to possess the property from which the offending sound is emitted at the time the offending sound is emitted, shall be responsible for compliance with this chapter if the additionally responsible party knows or should have known of the offending noise disturbance. It shall not be a lawful defense to assert that some other person caused the sound. The lawful possessor or operator of the premises shall be responsible for operating or maintaining the premises in compliance with this chapter and may be cited regardless of whether or not the person actually causing the sound is also cited.

C. Violation May be Declared a Public Nuisance. The operation or maintenance of any device, equipment, instrument, vehicle or machinery in violation of any provisions of this chapter which endangers the public health, safety and quality of life of residents in the area is declared to be a public nuisance, and may be subject to abatement summarily or by a restraining order or injunction issued by a court of competent jurisdiction. (Ord. 824 § 1.2, 2011; Ord. 740 § 1.2, 2007)

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing Without Project | *Project Name:* Ironwood Village (Tract No
Road Name: Nason St. | *Job Number:* 9385
Road Segment: s/o Ironwood Av.

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	4,300 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	430 vehicles
Vehicle Speed:	45 mph
Near/Far Lane Distance:	50 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	44.0 feet
Centerline Dist. to Observer:	44.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	0.000
Medium Trucks:	2.297
Heavy Trucks:	8.006

Grade Adjustment: 0.0

Lane Equivalent Distance (in feet)

Autos:	36.551
Medium Trucks:	36.308
Heavy Trucks:	36.332

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (CALVENO) - 10/1/2012

Scenario: Backyard No Wall
Road Name: Ironwood Av.
Lot No: 23

Project Name: Ironwood
Job Number: 9385
Analyst: A. Wolfe

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	30,000 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	3,000 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	50 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	233.0 feet
Centerline Dist. to Observer:	243.0 feet
Barrier Distance to Observer:	10.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	1,863.5 feet
Road Elevation:	1,839.5 feet
Barrier Elevation:	1,863.5 feet
Road Grade:	0.0%

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	1,839.500
Medium Trucks:	1,841.797
Heavy Trucks:	1,847.506

Grade Adjustment: 0.0

Lane Equivalent Distance (in feet)

Autos:	243.444
Medium Trucks:	243.181
Heavy Trucks:	242.621

FHWA Noise Model Calculations

VehicleType	REMEL	Traffic Flow	Distance	Finite Road	Fresnel	Barrier Atten	Berm Atten

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL (CALVENO) - 10/1/2012

Scenario: First Floor With Wall | *Project Name:* Ironwood
Road Name: Ironwood Av. | *Job Number:* 9385
Lot No: 20 | *Analyst:* A. Wolfe

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	30,000 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	3,000 vehicles
Vehicle Speed:	55 mph
Near/Far Lane Distance:	50 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	199.0 feet
Centerline Dist. to Observer:	219.0 feet
Barrier Distance to Observer:	20.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	1,854.7 feet
Road Elevation:	1,835.0 feet
Barrier Elevation:	1,854.7 feet
Road Grade:	0.0%

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	1,835.000
Medium Trucks:	1,837.297
Heavy Trucks:	1,843.006

Grade Adjustment: 0.0

Lane Equivalent Distance (in feet)

Autos:	218.966

AAI Certification:
We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Bernard A. Sentianin – Principal Geologist

EXECUTIVE SUMMARY

At the request and authorization of the Client (Global Investments and Development, LLC), EEI conducted a Phase I Environmental Site Assessment (ESA) for the property located northwest of Ironwood Avenue and Oliver Street, City of Moreno Valley, Riverside County, California. The purpose of this Phase I ESA was to assess the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment (i.e., recognized *environmental condition* as delineated in ASTM E1527-13). A D*e minimis* condition is not considered a *recognized environmental condition*.

The subject property is comprised of 75.1-acres of undeveloped land, on a single parcel identified by Assessor's Parcel Number (APN) 473-160-004-5. There is no street address associated with the subject property and the property is currently vacant land. Several unimproved roadways traverse the subject property. EEI understands that the subject property is proposed to be purchased by Global Investments and Development, LLC, for the purpose of residential development.

The rectangular shaped subject property is bound by mountainous and undeveloped land to the north. To the south, the property is bound by Ironwood Avenue, followed by residential development. To the east, the property is bound by an un-named access road, followed by undeveloped land. To the west, the property is bound by Nason Street, followed by residential development. According to the City of Moreno Valley zoning map, the northwest portion of the subject property is zoned as Hillside Residential (HR) and the remainder of the property is zone as Residential Agriculture (RA2).

Based on the information reviewed, with the exception of several unimproved roadways, the subject property has been historically undeveloped. Residential and agricultural development likely began in the property vicinity during the 1930s.

EEI contacted the County of Riverside Department of Environmental Health, California Department of Toxic Substances Control (DTSC), State Water Resources Control Board (SWRCB), and reviewed other state and federal databases to determine if the subject property, or any adjacent properties, were listed as hazardous waste generators, underground storage tank (UST) releases, or as having other environmental concerns (i.e., spill, leak, or aboveground tank [AST]). Neither the subject property nor any adjacent properties were listed on any of the databases researched.

On October 6, 2014, EEI personnel conducted a site reconnaissance to physically observe the subject property and adjoining properties for conditions indicating a potential environmental concern. Concerns would include any evidence of contamination, distressed vegetation, petroleum-hydrocarbon staining, waste drums, illegal dumping, or improper waste storage and/or handling. No evidence of environmental concern was noted on the subject property during our site reconnaissance.

EEI performed a Vapor Encroachment Screen (VES) for the subject property, in accordance with ASTM E2600-10. The purpose was to evaluate whether sites (e.g., gas stations, dry cleaners, or other listings of environmental concern) that store or dispose of potential chemicals of concern or have documented releases, may migrate as vapors onto the property, as a result of contaminated soil and/or groundwater which may be present on or near the property (i.e., a Vapor Encroachment Condition or VEC). Based on the results of a Tier 1 VES, EEI concluded that a VEC for the subject property can be ruled out, because a VEC does not or is not likely to exist due to the lack of known or suspected contaminated properties within the Area of Concern (AOC).

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of APN 473-016-004-5, the *subject property*. Any exceptions to, or deletions from, this practice are described in Section 7.0 of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the *subject property*.

1.0 INTRODUCTION

1.1 Purpose

The purpose of this Phase I Environmental Site Assessment (ESA) was to assess the possible presence of *recognized environmental conditions* for the property located northwest of Ironwood Avenue and Oliver Street, in the City of Moreno Valley, Riverside County, California (**Figure 1**). *Recognized environmental condition*s *(RECs)* include property uses that may indicate the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The term *RECs* is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment, and that would not be subject to enforcement action by a regulatory agency.

This ESA was performed in general conformance with the American Society for Testing and Materials (ASTM) *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, Designation E1527-13.

1.2 Scope of Services

The following scope of services was conducted by EEI:

- A review of readily available documents which included topographic, geologic, and hydrogeologic conditions associated with the subject property.

- A review of readily available maps, aerial photographs and other documents relative to historical subject property usage and development.

- A review of readily available federal, state, county, and city documents and database files concerning hazardous material storage, generation and disposal, active and inactive landfills, existing environmental concerns, and associated permits related to the subject property and/or immediately adjacent sites.

- A site reconnaissance to ascertain current conditions of the subject property.

- Interviews with person(s) knowledgeable of the subject property.

- The preparation of this report which presents our findings, conclusions, and recommendations.

1.3 Reliance

This ESA has been prepared for the sole use of Global Investments and Development, LLC (Client). This assessment should not be relied upon by other parties without the express written consent of EEI and the Client. Any use or reliance upon this assessment by a party other than Client; therefore, shall be solely at the risk of such third party and without legal recourse against EEI, its employees, officers, or directors, regardless of whether the action in which recovery of damages is brought or based upon contract, tort, statute or otherwise.

This assessment should not be interpreted as a statistical evaluation of the subject property, but rather is intended to provide a preliminary indication of onsite impacts from previous site usage and/or the release of hazardous materials. If no significant indicators of the presence of hazardous materials and/or petroleum contamination are encountered during this search, this does not preclude their presence.

The findings in this report are based upon published geologic and hydrogeologic information and information (both documentary and oral) provided by City of Moreno Valley, the County of Riverside, Environmental Data Resources Inc. (EDR®) (i.e., agency database search, and various state and federal agencies, and EEI's field observations. Some of these data are subject to change over time. Some of these data are based on information not currently observable or measurable, but recorded by documents or orally reported by individuals.

2.0 PHYSIOGRAPHIC SETTING

2.1 Subject Property Description

The subject property is located northwest of the intersection of Ironwood Avenue and Oliver Street, in the City of Moreno Valley, Riverside County, California (**Figure 2**). The subject property is comprised of 75.1-acres of undeveloped land, on a single parcel identified by Assessor's Parcel Number (APN) 473-160-004-5 (**Appendix B**). There is no street address associated with the subject property and the property is currently vacant land. Several unimproved roadways traverse the subject property. EEI understands that the subject property is proposed to be purchased by Global Investments and Development, LLC, for the purpose of residential development.

The rectangular shaped subject property is bound by mountainous, undeveloped land to the north. To the south, the property is bound by Ironwood Avenue, followed by residential development. To the east, the property is bound by an un-named access road, followed by undeveloped land. To the west, the property is bound by Nason Street, followed by residential development. According to the City of Moreno Valley zoning map, the northwest portion of the subject property is zoned as Hillside Residential (HR) and the remainder of the property is zone as Residential Agriculture (RA2).

Based on the information reviewed, with the exception of several unimproved roadways, the subject property has been historically undeveloped. In 1985, it appeared a small area of the subject property, located in the northern and central portion, was utilized for agriculture; this agriculture appeared to be removed from the subject property by the time of the following aerial photograph in 1989. Residential and agricultural development likely began in the site vicinity during the 1930s.

2.2 Topography

The subject property is located on the United States Geological Survey (USGS) 7.5 Minute Sunnymead Quadrangle map (USGS, 1980). The map indicates the elevation of the subject property ranges from approximately 1,830 feet above mean sea level (amsl) in the southern portions to 1,920 feet amsl in the northern portions. The northern portion of the subject property is characterized by steeply sloping mountainous terrain and the southern portion of the property appears to have moderate to gentle topography. The subject property slopes downwards to the south and any surface runoff generated on the property would flow towards the south and southwest.

2.3 Regional and Local Geology

The subject property lies within the Peninsular Ranges Geomorphic Province. The Peninsular Ranges geomorphic province, one of the largest geomorphic units in western North America, extends from the Transverse Ranges geomorphic province and the Los Angeles Basin, south to Baja California. It is bound on the west by the Pacific Ocean, on the south by the Gulf of California and on the east by the Colorado Desert Province. The Peninsular Ranges are essentially a series of northeast-southeast oriented fault blocks (CGS, 2002).

Three major fault zones and some subordinate fault zones are found in this province. The Elsinore Fault zone and the San Jacinto Fault zone trend northwest-southeast, and are found near the middle of the province. The San Andreas Fault zone borders the northeasterly margin of the province, whereas, a fault related to the San Andreas Transform Fault System, the Newport-Inglewood-Rose Canyon Fault zone exists near the western margin and Continental Borderland Geomorphic Province (CDMG, 1998). The nearest major active fault, the Claremont Fault, is located approximately one and one-half miles northeast of the subject property (CGS, 2010). According to the 2010 geologic maps of California, the central and southern portions of the subject property are underlain by Quaternary aged, semi-consolidated alluvium, lake or playa deposits, and in the northwestern portion of the property, is underlain by Mesozoic aged granites,

Soil in the vicinity of the subject property has been identified by the United States Department of Agriculture - Natural Resource Conservation Service, online Web Soil Survey database as a mix of Monserate Sandy Loam and the Hanford coarse sandy loam. The Monserate sandy loams formed in alluvial fans from granitic rocks and occur on slopes of 15 to 25 percent (USDA, 2014). Monserate sandy loams are up to 70-inches thick, well drained and have a very low capacity to transmit water. Hanford coarse sandy loams are typically 60-inches thick, well drained soils, with a high capacity to transmit water. These soils form in alluvial fans from granitic rocks and occur on slopes of 2 to 8 percent.

2.4 Regional and Local Hydrogeology

According to the California Regional Water Quality Control Board, Santa Ana Region, Water Quality Control Plan - Santa Ana River Basin (8) (SARWQCB, 1995), the subject property is located within the Perris North Hydrologic Area, of the San Jacinto Valley Hydrologic Unit. Groundwater in this subarea has been designated as beneficial for municipal domestic, agricultural, industrial process and industrial supply.

The California Department of Water Resources Water Data Library (WDL, 2014) website does not indicate the presence of water supply wells located on the subject property (Township 02 South, Range 03 West, Section 34); however, two wells were indicated within one-mile of the subject property. Data indicated depth to groundwater in Well No. EMWD12003, located approximately three-quarter miles northeast, was 239 feet as measured in 2014. Data from the second nearby well, state Well No. 002S03W34C001S, located approximately eight-tenths of a mile north-northwest, indicated depth to groundwater was 240 feet, as measured in 2014. Based solely on topography, groundwater flow direction for the subject property would be expected to flow to the south.

2.5 Hydrologic Flood Plain Information

EEI reviewed the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) online database and the Riverside County Land Information System (RCLIS) to determine if the subject property was in a flood zone. The subject property is located on two separate FIRM maps.

According to FIRM Number FM06065C0755G, Panel No. 0755 of 3805 and FIRM Number FM06065C0760G, Panel No. 0760 of 3805 – both effective August 28, 2008, the subject property is located within flood Zone X. FEMA defines Zone X as an area of minimal flood hazard, usually depicted on FIRMs as above the 500-year flood level. The FIRM also indicates that a small area of the subject property at the southeast corner, and adjacent property to the southeast, are located within Zone A. FEMA defines Zone A as areas with a 1% annual chance of flooding and a 26% chance of flooding over the life of a 30-year mortgage. A copy of the FIRM is included in **Appendix B**.

2.6 Protected Flora and Fauna and/or Wetlands

EEI contacted the county of Riverside for information regarding protected flora and fauna and/or wetlands on or near the subject property. According to the Riverside County Integrated Project (RCIP), the subject property lies within an independent cell group of the Reche Canyon/Badlands Area Plan, of the Proposed Multiple Species Habitat Conservation Plan (MSHCP) (**Appendix B**). According to MSHCP, the subject property is located within an area group with high conservation goals. The MSHCP states that prior to property development; a site assessment which addresses the following MSHCP sections should be conducted by a qualified biologist:

- Section 6.1.2 Protection of Species associated with Riparian/Riverine areas and Vernal Pools
- Section 6.1.3 Protection of Narrow Endemic Plant Species
- Section 6.1.4 Guidelines pertaining to the Urban/Wildlands Interface

In addition, the MSHCP states that a habitat assessment is required to address at a minimum, potential habitat for the Burrowing Owl. According to the MSHCP, if potential habitat for the aforementioned species is determined to be located on the property, focused surveys may be required during the appropriate season.

3.0 SUBJECT PROPERTY BACKGROUND

3.1 Subject Property Ownership

Information regarding subject property ownership was obtained from the county of Riverside Assessor's office and a Preliminary Title Report (PTR) prepared by Title 365, dated February 13, 2014. According to the information reviewed, the current ownership of the subject property is vested in Ironwood 8 Properties, a California Limited Partnership. A copy of the PTR is included in **Appendix B.**

3.2 Subject Property History

EEI reviewed readily available information sources to evaluate historic land use in and around the subject property. These information sources include aerial photographs, USGS maps, City of Moreno Valley and County of Riverside Planning and Building and Safety Department files. The information sources are reviewed in the following sections.

3.2.1 Historical Use Review

Aerial photographs and historical topographical maps, provided by EDR®, were reviewed to identify historical land development and any surface conditions which may have impacted the subject property. Photographs and historical topographic maps dating between 1901 and 2012 were reviewed. A 2012 aerial photograph was obtained from Google Earth®, a copy of which is included herein (**Figure 2**). **Table 1** summarizes the results of the aerial photograph and historical topographic map review. Copies of the aerial photographs and historical topographic maps provided by EDR®, Inc. are included in **Appendix C**.

Based on the information reviewed, with the exception of several unimproved roadways, the subject property has been historically undeveloped. Residential and agricultural development likely began in the site vicinity during the 1930s.

TABLE 1
Summary of Historical Use Review

Year	Source and Scale	Comments
1901	Topographic Maps 1:250,000/ 250'000	Scale of the map did not allow for a detailed review of the subject property. Subject property appeared in the general area north of Moreno Valley. The city of Moreno Valley appeared with limited urban development.
1938	Aerial Photograph 1-inch = 500 feet	Subject property and adjacent property appeared as undeveloped land located to the north of Ironwood Avenue. The southern and central portions of the subject property appeared to be cleared of vegetation. Ironwood Avenue appeared as an unimproved road to the south. An unimproved roadway enters the subject property from the north. Land to the north, south and west appeared to be undeveloped. Land to the east appeared to be developed for agriculture. There is limited agricultural development in the subject property vicinity.
1943	Topographic Map 1:62,500	Subject property and adjacent property appeared as undeveloped land located to the northwest of Ironwood Avenue and Nason Street. Ironwood Avenue appeared as an improved road. Two unimproved roadways are present on the subject property. Land to the north, south and west appeared to be undeveloped. Land to the east appeared to be developed for agriculture.
1953	Topographic Map 1:24,000	Subject property and surrounding properties appeared as they did in the 1943 map, except the northern portion of the subject property appeared to be developed with a windmill.
1953/ 1966	Aerial Photographs 1-inch = 500 feet	Subject property and adjacent properties appeared as they did in the 1938 photograph except an additional portion in the north of the subject property appeared to be cleared of vegetation. There is an increase in agricultural development in surrounding properties and a residential structure appeared north of the subject property in the 1966 photo.
1967	Topographic Map 1:24,000	Subject property appeared as it did in the 1943 map. Increased agricultural development appeared north of the subject property. Limited residential appeared on the adjacent property to the east of the subject property. Land to the south and east of the subject property appeared as undeveloped land.
1973	Topographic Map 1:24,000	Subject property, adjacent property and surrounding property appeared as it did in the 1967 map, except the adjacent property to the south appeared with increased agricultural development.
1975	Aerial Photograph 1-inch = 500 feet	Resolution of photo did not allow for detailed analysis of the subject property. Subject property and vicinity appeared as it did in the 1966 photograph. An additional unimproved roadway appeared to enter the subject property from the west.
1980	Topographic Map 1:24,000	Subject property, adjacent property and surrounding property appeared as it did in the 1973 map.
1985	Aerial Photograph 1-inch = 500 feet	A small area in the northern and central portion of the subject property appeared to be developed with agriculture. The rest of the subject property appeared as it did in the 1975 and 1966 photographs. Increased residential and agricultural development appeared west of the subject property. Land to the south of the subject property appeared to be graded for development.
1989	Aerial Photograph 1-inch = 500 feet	Agriculture appeared to be cleared from the subject property. Except for the northwest portion, the subject property appeared to be cleared of vegetation. There is an increase in residential development on the adjacent property to the south.

TABLE 1
Summary of Historical Use Review

Year	Source and Scale	Comments
1994/ 2002/ 2005/ 2006/ 2009 2010/ 2012	Aerial Photographs 1-inch = 500 feet	No apparent changes appeared on the subject property or adjacent properties since the 1989 photograph. Several unimproved roadways appeared to cross the central portion of the subject property in the 2002 photograph. The subject property appeared to be disced or partially graded in the 2009 photograph. Residential development increased to the south of the subject property in the 2002 photograph.
2012	Aerial Photograph Google Earth (Color)	Subject property appeared in its current configuration, as undeveloped land with several unimproved roadways. The southern portion of the subject property appeared to have been disced or partially graded in a grid pattern. Land to the north and east appeared as undeveloped. Land to the south is developed by Ironwood Avenue, followed by single family residential development. To the west, the subject property is bound by Nason Street, followed by rural residential development.

3.2.2 City/County Directories

Due to the absence of development of the subject property and recent development of the surrounding area, this information source was not researched as it was not deemed to be sufficiently useful and not researched during this Phase I ESA.

3.2.3 Sanborn Fire Insurance Maps

Sanborn Fire Insurance maps were developed in the late 1800s and early 1900s for use as an assessment tool for fire insurance rates in urbanized areas. A search was made at the Los Angeles Public Library's collection of Sanborn Fire Insurance Maps. Sanborn map coverage was not available for the subject property indicating little or no development in the subject property vicinity prior to 1950.

3.2.4 City of Moreno Valley Building and Safety Department Files

EEI contacted the City of Moreno Valley, Building and Safety Department, to review any existing files related to the subject property. According to personnel with the Building and Safety Department, a search of the subject property's APN revealed that there are no planning cases or building permits on file for the subject property.

3.3 Regulatory Database Search

EEI reviewed known electronic database listings for possible hazardous waste generating establishments in the vicinity of the subject property, as well as adjacent sites with known environmental concerns. Facilities were identified by county, state, or federal agencies that generate, store, or dispose of hazardous materials. The majority of information in this section was obtained from EDR®, an environmental information/database retrieval service. A copy of the EDR® report is provided in **Appendix D,** along with a description of the individual databases. The subject property was not listed on any of the databases reviewed as having environmental concerns. Following is a list of databases that were reviewed in the preparation of this report.

3.3.1 Federal Databases

Federal National Priority site list (NPL) – No listings were reported within a one mile radius of the subject property.

Federal Delisted NPL site list – No listings were reported within a one mile radius of the subject property.

Federal Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) list – No listings were reported within a one-half mile radius of the subject property.

Federal CERCLIS No Further Assessment Planned (NFRAP) site list – No listings were reported within a one-half mile radius of the subject property.

Federal Resource Conservation Recovery Act (RCRA) Corrective Action Sites (CORRACTS) facilities list – No listings were reported within a one mile radius of the subject property.

Federal RCRA non-CORRACTS facilities list – No listings were reported within a one mile radius of the subject property.

Federal RCRA non-CORRACTS Treatment, Storage and Disposal (TSD) facility list (RCRA-TSDF) – No listings were reported within a one-half mile radius of the subject property.

Federal RCRA generators list (RCRA-LQG SQG CESQG) – No listings were reported within a one-quarter mile radius of the subject property.

Federal institutional controls/engineering controls (IC/EC) registries – No listings were reported within a one-half mile radius of the subject property.

Federal Emergency Response Notification System (ERNS) – No listings were reported for the subject property.

The subject property was not identified on any of the above-referenced databases researched.

3.3.2 State and Regional Sources

State and Tribal equivalent NPL sites – No listings were reported within a one mile radius of the subject property.

State/Tribal equivalent CERCLIS sites – No listings were reported within a one mile radius of the subject property.

State and tribal landfill and/or solid waste disposal site lists – One listing was reported within a one-half mile radius of the subject property. The listing, **Badlands Sanitary Landfill** (31125 Ironwood Avenue, 0.34 miles west) is listed as active permitted solid waste landfill, operated by the County of Riverside Waste Management Department, that accepts agricultural, ash, construction, green, industrial, inert, metal mixed municipal, tire and wood wastes. The site has operated as a landfill since 1966 and was operated as a burn site until early 1977. Site has been issued several notices in relation to runoff control compliance. Based on topographical separation and distance from the subject property (greater than one-quarter mile) this site is not considered to be an environmental concern.

State and tribal leaking storage tank lists – No listings were reported within a one-half mile radius of the subject property.

State and tribal registered storage tank lists – No listings were reported within a one-quarter mile radius of the subject property.

State and Tribal voluntary cleanup sites – No listings were reported within a one-half mile radius of the subject property.

Local Brownfield lists – No listings were reported within a one-half mile radius of the subject property.

Local Lists of Landfill and Hazardous Waste/Contaminated Sites – One listing was reported within a one-half mile radius of the subject property. The listing, **Badlands Sanitary Landfill** (31125 Ironwood Avenue, 0.34 miles west) is listed as active permitted solid waste landfill, operated by the County of Riverside Waste Management Department, that accepts agricultural, ash, construction, green, industrial, inert, metal mixed municipal, tire and wood wastes. The site has operated as a landfill since 1966 and was operated as a burn site until early 1977. Site has been issued several notices in relation to runoff control compliance. Based on topographical separation and distance from the subject property (greater than one-quarter mile) this site is not considered to be an environmental concern.

Local Lists of Registered Storage Tanks – No listings were reported within a one-quarter mile radius of the subject property.

Local Land Records – No listings were reported within a one-half mile radius of the subject property.

Records of Emergency Release Reports – No listings were reported for the subject property.

Other Ascertainable Records – No listings were reported within a one mile radius of the subject property.

EDR Exclusive Records – No listings were reported within a one mile radius of the subject property.

Exclusive Recovered Government Archives – No listings were reported within a one-half mile radius of the subject property.

Orphan Summary – The EDR® database search report lists a number of sites identified as "orphans." EDR was unable to confirm the physical locations of these sites relative to the subject property or to assess whether they were located within the designated search radii. EEI attempted to locate these "orphan" sites, to the extent possible, using various maps and our knowledge of the site area. Any of the "orphan" sites determined to be within the designated search radii were included in our evaluation of the various listed sites with potential to result in a recognized environmental condition relative to the subject property.

3.4 Regulatory Agency Review

3.4.1 City of Moreno Valley/Riverside County Fire Departments

EEI contacted the City of Moreno Valley and Riverside County Fire Departments concerning any permit, inspection, UST, or cleanup information available for the subject site. According to both the City and County Fire Department personnel, neither department's hold or track permits regarding hazardous materials. This information is regulated by the County of Riverside Department of Environmental Health (see Section 3.4.2). No other pertinent information was available with the RCFD.

3.4.2 County of Riverside Department of Environmental Health

EEI contacted the County of Riverside Department of Environmental Health (CRDEH) for information regarding any Underground Storage Tank (UST) permits, LUST cases, Hazardous Waste Generator permits, Emergency Responses, Complaint and Investigation (ERCI) documents, DTSC Calsite listings, and Superfund Site listings, pertaining to the subject property. According to the RCDEH, the aforementioned database listings are reported by site address. Given that the subject property does not have an assigned address, this information source was not deemed to be sufficiently useful; and therefore, not researched during this Phase I ESA.

3.4.3 Department of Toxic Substances Control

EEI reviewed the Department of Toxic Substances Control (DTSC, 2014) online database EnviroStor for listings on or adjacent to the subject property. The subject property was listed as the site of a DTSC school investigation. EEI reviewed information provided by the website and found that, because the subject property was the proposed location of a high school, the DTSC required a Phase I Environmental Site Assessment (ESA) to investigate any potential recognized environmental conditions (RECs) in connection with the subject property. The Phase I ESA, prepared by The Planning Center, titled **Proposed Alternate High School No. 5 – Ironwood/Nason, Moreno Valley, California**, dated June 25, 2008, stated that the subject property had been undeveloped since 1901 and found no RECs in connection with the subject property. The report recommended no further assessment or investigation. The DTSC concurred with the findings of the Phase I and issued a No Further Action determination as of July 31, 2008. See Section 3.7.1 for a detailed summary of this assessment.

3.4.4 State Water Resources Control Board

EEI reviewed the Spills, Leaks, Investigations, and Cleanup (SLIC) list, as well as the online database GeoTracker, which provides records on LUSTs, both maintained by the State Water Resources Control Board (SWRCB, 2014). Neither the school or subject property was listed as a DTSC investigation site. Please see Sections 3.4.3 and 3.7.1 for a detailed summary.

3.4.5 Review of Division of Oil, Gas and Geothermal Resources Files

Oil and gas wells were not observed at the subject property during our site reconnaissance. A review of the California Division of Oil, Gas, and Geothermal Resources Website for oil and gas fields in California and Alaska (CDOGGR, 2014) did not indicate the presence of oil and gas wells on or adjacent to the subject property (Township 02 South, Range 03 West, and Section 34).

3.4.6 National Pipeline Mapping System

EEI reviewed the National Pipeline Mapping System (NPMS, 2014) public viewer website for gas transmission pipelines and hazardous liquid trunklines on or close to the subject property. According to the information reviewed, no pipelines are located on or in close proximity to the subject property.

3.5 Interview with Current Property Owner

EEI contacted the property owners, Mr. Chang Chung Yang and Mrs. Fu Mei Yang, for information regarding the subject property. Mr. and Mrs. Yang provided the information documented below.

3.5.1 Past or Present Uses Indicating Environmental Concerns

Mr. and Mrs. Yang stated that the subject property is not in use and has not been used since it was purchased.

3.5.2 Environmental Liens or Governmental Notifications

Mr. and Mrs. Yang stated that they are not aware of any environmental liens or governmental notification relating to past or recurrent violations of environmental laws with respect to the property or any facility located on the subject property.

3.5.3 Presence of Hazardous Substances or Environmental Violations

Mr. and Mrs. Yang stated that they are not aware of any hazardous substances or environmental violations on the subject property.

3.5.4 Previous Assessments

Mr. and Mrs. Yang stated that an environmental impact assessment was done by the City of Moreno Valley as a part of its feasibility study to us the subject property for a new high school. According to Mr. and Mrs. Yang, the assessment reported no negative findings.

3.5.5 Legal Proceedings

Mr. and Mrs. Yang stated that they are not aware of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any hazardous substance or petroleum products involving the property by any owner or occupant of the subject property.

3.6 User Specific Information

Pursuant to ASTM E1527-13, EEI provided a Phase I ESA User Specific Questionnaire to the “user” (the person on whose behalf the Phase I ESA is being conducted), Mr. Joseph Rivani, with Global Investments and Development, LLC. The User Specific Information provided by Mr. Rivani is documented below. A list of the user specific questions (per ASTM E1527-13) with associated responses is included in **Appendix E**.

3.6.1 Environmental Liens or Activity and Use Limitations

Mr. Rivani was unaware of any environmental liens or activity and use limitations in association with the subject property. To supplement this information, a Preliminary Title report was obtained from the Client. A review of the report confirmed the absence of any environmental liens or and other activity and use limitations (AULs) associated with the subject property.

3.6.2 Specialized Knowledge

Mr. Rivani stated that he has no specialized knowledge or experience related to the property or nearby properties (i.e., knowledge of the chemicals or processes used by a type of business).

3.6.3 Valuation Reduction for Environmental Issues

Mr. Rivani stated that the purchase price being paid for the subject property reasonably reflects the fair market value of the property.

3.6.4 Presence or Likely Presence of Contamination

Mr. Rivani stated that he was not aware of any environmental issues related to the subject property.

3.6.5 Other

Mr. Rivani stated that the Phase I ESA is required by City of Moreno Valley. The type of property transaction in the case of the subject property was described by Mr. Rivani as a sale.

3.7 Previous Assessments

3.7.1 The Planning Center, Phase I ESA, Proposed Alternate High School No. 5 – Ironwood/Nason, Moreno Valley, California, Dated June 25, 2008

The above-referenced ESA was conducted for the subject property, consisting of 75.1-acres on a single parcel identified by APN 473-160-004-5, known as the Proposed Alternate High School No. 5 – Ironwood/Nason property. The Phase I was prepared as required by the DTSC because the subject property was the proposed location of a high school.

The Planning Center (PC) conducted the site visit on May 16, 2008, and noted that the subject property was undeveloped land, situated in an area with both undeveloped land and residential development. PC stated that the subject property had been undeveloped since 1901 and had never been used for agriculture. PC also noted that site water would be provided to the site by the Eastern Municipal Water District, who sources its water from the Colorado River Aqueduct and groundwater wells. PC's assessment revealed no evidence of any recognized environmental conditions in connection with the subject property. The report recommended no further assessment or investigation of the subject property.

3.8 Other Environmental Issues

3.8.1 Asbestos-Containing Materials

Asbestos, a natural fiber used in the manufacturing of a number of different building materials, has been identified as a human carcinogen. Most friable (i.e., easily broken or crushed) Asbestos-Containing Materials (ACM) were banned in building materials by 1978. By 1989, most major manufacturers had voluntarily removed non-friable ACM (i.e., flooring, roofing, and mastics/sealants) from the market. These materials, however, were not banned completely.

The subject property is currently undeveloped land; therefore, the presence of Asbestos-Containing Materials is not considered an environmental concern.

3.8.2 Lead-Based Paint

Lead-Based Paint has been identified by Occupational Safety and Health Administration (OSHA), the United States Environmental Protection Agency (U.S. EPA) and the Department of Housing and Urban Development (HUD) as being a potential health risk to humans, particularly children, based on its effects to the central nervous system, kidneys, and bloodstream. The risk of Lead-Based Paint has been classified by HUD based upon the age and condition of the painted surface.

The subject property is currently undeveloped land; therefore, the presence of Lead-Based Paint is not considered an environmental concern.

3.8.3 Radon

Radon is a radioactive gas which has been identified as a human carcinogen. Radon gas is typically associated with fine-grained rock and soil, and results from the radioactive decay of radium. The U.S. EPA recommends that homeowners in areas with radon screening levels greater than 4 Picocurries per liter (pCi/L) conduct mitigation of radon gas to reduce exposure.

Sections 307 and 309 of the Indoor Radon Abatement Act of 1988 (IRAA) directed the U.S. EPA to list and identify areas of the U.S. with the potential for elevated indoor radon levels. U.S. EPA's Map of Radon Zones (EPA-402-R-93-071) assigns each of the 3,141 counties in the U.S. to one of three zones based on radon potential:

- Zone 1 counties have a predicted average indoor radon screening level greater than 4 pCi/L.
- Zone 2 counties have a predicted average indoor radon screening level between 2 and 4 pCi/L.
- Zone 3 counties have a predicted average indoor radon screening level less than 2 pCi/L.

Based on such factors as indoor radon measurements, geology, aerial radioactivity, and soil permeability; the U.S. EPA has identified the County of Riverside as Zone 2 (i.e., a predicted average indoor radon screening level between 2 and 4 pCi/L). EEI does not consider radon as a significant environmental concern at this time.

4.0 SITE RECONNAISSANCE

4.1 Purpose

The purpose of our site reconnaissance was to physically observe the subject property, site structures (if any), and adjoining properties for conditions indicating an existing release, past release, or threatened release of any hazardous substances or petroleum products into structures on the subject site, or into soil and/or groundwater beneath the subject property. This would include any evidence of contamination, distressed vegetation, petroleum-hydrocarbon surface staining, waste drums, USTs, ASTs, illegal dumping, or improper waste storage/handling. Detailed information pertaining to our site reconnaissance is provided in the text below.

4.2 Subject Property

On October 6, 2014, EEI personnel conducted a site reconnaissance to visually observe the subject property and adjoining properties for conditions indicating a potential environmental concern. Visual conditions present during the site reconnaissance are documented in the Photographic Log (**Appendix G**), and summarized in **Table 2**.

The subject property is located northwest of the intersection of Ironwood Avenue and Oliver Street, in the City of Moreno Valley, California (**Figure 2**). The subject property is located within Riverside County on a single parcel, denoted by the APN: 473-160-004-5. The subject property is located on the north side of Ironwood Avenue, bound by Oliver Street to the east, Nason Street to the west, and rural open land to the north. The subject property is rectangular in shape, oriented west-east, and comprises roughly 75.1 acres in size. The subject property is currently undeveloped open land, with no structural development. The subject property is currently vacant, and is not assigned a specific address.

EEI staff accessed the subject property by vehicle along the intersection of Ironwood Avenue and Nason Street, through one of the many unimproved roadways located on the property. The subject property was open and unfenced on all boundaries, with the exception of one locked gate northbound of the intersection of Ironwood Avenue and Oliver Street. This inaccessible gravel road leads up to a water storage tank, beyond the subject property. EEI staff entered the site and continued the site reconnaissance by both vehicle and foot, in order to properly assess the property and gain practical vantage points. Overhead power lines were noted on the southern perimeter of the subject property, along Ironwood Avenue. EEI personnel observed what appeared to be seven roughly graded or disced patches, oriented both north-south and west-east, which spanned the entire subject property. Staff also noted random debris and littering throughout the subject property. The trash observed included broken piping, tires, plastic recyclables, cardboard, and other windblown debris. With the exception of the small amounts of litter and windblown debris located throughout the subject property, EEI staff did not recognize any other conditions which would indicate a potential environmental concern.

The ground surface on the subject property consists of undeveloped land with a mix of natural soils and native vegetation. The overall property locale is characterized by high topographic relief, sloping downward to the south. Based on topography, surface runoff generated on the subject property would flow south towards Ironwood Avenue, eventually ending up in the local storm drain system.

No evidence of contamination, distressed vegetation, petroleum-hydrocarbon surface staining, waste drums, USTs, ASTs, illegal dumping, or improper waste storage/handling was noted during our site reconnaissance.

TABLE 2
Summary of Site Reconnaissance

Item	Concerns	Comments
General Housekeeping	No	No concerns observed.
Surface Spills	No	No concerns observed.
Stained Surfaces	No	No concerns observed.
Fill Materials	No	No concerns observed.
Pits/Ponds/Lagoons	No	No concerns observed.
Surface Impoundments	No	No concerns observed.
ASTs/USTs	No	No concerns observed.
Distressed Vegetation	No	No concerns observed.
Wetlands	No	No concerns observed.
Electrical Substations	No	No concerns observed.
Areas of Dumping	No	No concerns observed.
Transformers	No	No concerns observed.
Waste/Scrap Storage	No	No concerns observed.
Chemical Use/Storage	No	No concerns observed.

4.3 Adjacent Properties

EEI conducted a visual and auto reconnaissance of the adjoining neighborhoods (to the extent practical) to evaluate the potential for offsite impacts that may affect the subject property. These would include evidence of chemical storage or usage, surface staining or leakage, distressed vegetation, or evidence of illegal dumping.

The subject property is located northwest of the intersection of Ironwood Avenue and Oliver Street, with adjacent properties consisting of a mix of rural, undeveloped land, and single-family residences. To the north, the subject property is bound by mountainous terrain and undeveloped land. To the south, the subject property is bound by Ironwood Avenue, followed by a single-family residential development. To the west, the subject property is bound by Nason Street, followed by both single-family residences and undeveloped land. To the east, the subject property is bound by Oliver Street, followed by rural, undeveloped land.

Adjacent properties were not identified as having environmental related issues on any of the databases researched, and are not considered as an environmental concern at this time. No service stations, dry cleaners, or industrial properties were located in the immediate vicinity.

5.0 VAPOR ENCROACHMENT SCREEN

ASTM Standard E2600-10 Standard Guide for Vapor Encroachment Screening (VES) on Property Involved in Real Estate Transactions was used as guidance for conducting a VES for the subject property. The purpose of the screening is to determine whether a Vapor Encroachment Condition (VEC) exists from chemicals of concern (COC*)* that may migrate as vapors onto a property as a result of contaminated soil and groundwater on or near the subject property. The screening involves a two tiered approach to assessing VEC risk as described below. The VES process includes a review of site conditions (e.g., aerial photographs, city directories, and environmental database information), which is information typically collected during a Phase I ESA, user provided information, and in some instances the use of a third-party vapor encroachment application. The following sections describe the VES performed on the subject property.

5.1 Subject Property Conditions

The subject property is located northwest of the intersection of Ironwood Avenue and Oliver Street, in the City of Moreno Valley, Riverside County, California (**Figure 2**). The subject property is comprised of 75.1-acres of undeveloped land, on a single parcel identified by Assessor's Parcel Number (APN) 473-160-004-5 (**Appendix B**). There is no street address associated with the property and the property is vacant land. Several unimproved roadways traverse the subject property. EEI understands that the subject property is proposed to be purchased by Global Investments and Development, LLC, for the purpose of residential development.

The rectangular shaped subject property is bound by mountainous and undeveloped land to the north. To the south, the property is bound by Ironwood Avenue, followed by residential development. To the east, the property is bound by an un-named access road, followed by undeveloped land. To the west, the property is bound by Nason Street, followed by residential development.

Based on the information reviewed, with the exception of several unimproved roadways, the subject property has been historically undeveloped. Residential and agricultural development likely began in the subject property vicinity during the 1930s.

Based on EEI's historical review, there has been no man-made vapor conduits identified on or immediately adjacent to the subject property.

Soil in the vicinity of the subject property has been identified by the USDA-NRCS, online Web Soil Survey database as a mix of Monserate Sandy Loam and the Hanford coarse sandy loam. The Monserate sandy loams formed in alluvial fans from granitic rocks and occur on slopes of 15 to 25 percent (USDA, 2014). Monserate sandy loams are up to 70-inches thick, well drained and have a very low capacity to transmit water. Hanford coarse sandy loams are typically 60-inches thick, well drained soils, with a high capacity to transmit water. These soils form in alluvial fans from granitic rocks and occur on slopes of 2 to 8 percent.

The California Department of Water Resources Water Data Library (WDL, 2014) website does not indicate the presence of water supply wells located on the subject property (Township 02 South, Range 03 West, Section 34); however, two wells were indicated within one-mile of the subject property. Data indicated depth to groundwater in Well No. EMWD12003, located approximately three-quarter miles northeast, was 239 feet as measured in 2014. Data from the second nearby well, state Well No. 002S03W34C001S, located approximately eight-tenths of a mile north-northwest, indicated depth to groundwater was 240 feet, as measured in 2014. Based solely on topography, groundwater flow direction for the subject property would be expected to flow to the south.

5.2 User Provided Information

To assist EEI in the completion of the VES, Mr. Joseph Rivani, with Global Investments and Development, LLC, completed a Vapor Encroachment Screen - User Questionnaire (**Appendix G**). The questionnaire provided basic information regarding the use, condition, and proposed development of the subject property.

According to Mr. Joseph Rivani, the property is proposed to be developed with single-family, detached residential units. Hot air circulation and hot water radiation are the proposed heating systems. Fuel energy in the proposed development will come from natural gas and electricity. Mr. Rivani stated that he does not know of any reported instances of gas stations, cleaners, storage tanks, odors, chemicals, or health concerns reported on the property.

5.3 Tier 1 Screening – Search Distance Test/Chemicals of Concern

A Tier 1 Screening includes the search distance test that involves a review of the regulatory database report and available historical records obtained during the Phase I ESA process to make a determination if any *known or suspect potentially contaminated* properties exist within the Area of Concern (AOC). High risk sites are typically current and former gas stations, former and current dry cleaners, manufactured gas plants, and industrial sites (Brownfields). The AOC is defined as any up gradient sites within the ASTM E1527-13 standard search distances and any cross or down gradient sites within 1/3 mile for solvents and petroleum products.

If the contamination at the known site or potentially contaminated sites within the AOC consists of Chemicals of Concern (COCs), then a potential Vapor Encroachment Condition (pVEC) exists, and a Tier 2 Screening evaluation is recommended. If no known or potentially contaminated sites with COCs exist within the AOC, no further inquiry is necessary. Based on EEI's Tier 1 Screening evaluation, no sites were identified within the AOC that were considered to pose a pVEC at the subject property.

5.4 Findings

Based on the results of the Tier 1 VES, EEI concluded that a Vapor Encroachment Condition (VEC) for the subject property can be ruled out, because a VEC does not or is not likely to exist due to the lack of known or suspected contaminated properties within the Area of Concern (AOC).

6.0 FINDINGS AND OPINIONS

Based on the information obtained in this ESA, EEI has the following findings and opinions:

- *Known or suspected REC's* – are defined by the ASTM Standard Practice E 1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

  No *known or suspected RECs* have been revealed during the preparation of this ESA.

- *Controlled REC's (CRECs)* – are defined by the ASTM Standard Practice E 1527-13 as a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (e.g., as evidenced by the issuance of a NFA letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (e.g., property use restrictions, AULs, institutional controls, or engineering controls)

  No *CREC's* have been revealed during the preparation of this ESA.

- *Historical Recognized Environmental Conditions (HRECs)* – are defined by the ASTM Standard Practice E 1527-13 as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted residential use criteria established by a regulatory authority, without subjecting the property to any required controls (e.g., property use restrictions, AULs, institutional controls, or engineering controls).

  No *HREC's* have been revealed during the preparation of this ESA.

- *De minimis* Conditions – include environmental concerns identified which may warrant discussion but do not qualify as RECs, as defined by the ASTM Standard Practice E 1527-13.

  No *de minimis* conditions were identified during the preparation of this ESA.

7.0 DATA GAPS AND DEVIATIONS FROM ASTM PRACTICES

Section 3.2.20 (ASTM 1527-13) defines a data gap as "a lack or inability to obtain information required by the practice despite good faith efforts of the environmental professional to gather such information."

7.1 Historical Data Gaps

Based on the information obtained during the course of this investigation, no historical data gaps were encountered.

7.2 Regulatory Data Gaps

Based on the information obtained during the course of this investigation, no regulatory data gaps were encountered.

7.3 Onsite Data Gaps

Based on the information obtained during the course of this investigation, no onsite data gaps were encountered.

7.4 Deviations from ASTM Practices

Section 12.10 (ASTM 1527-13), states that all deletions and deviations from this practice shall be listed individually and in detail, including Client imposed constraints, and all additions should be listed.

EEI believes that there are no exceptions to, or deletions from, the ASTM Designation E1527-13 Guidelines.

8.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-13 of APN 473-160-004-5, the *subject property*. Any exceptions to, or deletions from, this practice are described in Section 7.0 of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the *subject property*.

APPENDIX A
RESUME OF ENVIRONMENTAL PROFESSIONAL

Geotechnical & Environmental Solutions

BERNARD A. SENTIANIN, CPG, RG

Principal Geologist

SUMMARY

As Principal Geologist of EEI since 1997, Mr. Sentianin provides consulting and technical services as a project manager, expert witness, and senior geologist for investigation and cleanup efforts at sites impacted by Petroleum Hydrocarbons, heavy metals, pesticides, and chlorinated solvents. As a remediation specialist, he has hands on experience designing, installing, and managing large scale projects involving above ground and in-situ bioremediation, soil vapor extraction, sparging, and groundwater extraction/treatment. He has over 22 years of environmental project management experience, and 25 years professional geologic experience. Mr. Sentianin has extensive experience in planning, implementing and evaluating Phase I and Phase II environmental assessments in commercial real estate transactions following ASTM E1527-05, E1903-97 (-02), E2600-10, and 40 CFR Part 312 (AAI).

EDUCATION

1985 Bachelor of Science, Geology, California State University, Bakersfield
1989 Master of Science, Geological Sciences, San Diego State University

REGISTRATIONS/CERTIFICATIONS

Registered Environmental Assessor I No. 3477, State of California.
Professional Geologist No. 5530, State of California.
Certified Professional Geologist No. 9059, American Institute of Professional Geologists
OSHA 40-Hour HAZWOPER Training and 8-Hour Refreshers

WORK HISTORY

1991 TO 1997 Senior Geologist, Senior Project Manager
PW Environmental
Established in-house engineering and consulting services for mid-sized environmental contractor. Established regulatory, vendor, and client contacts. Initiated policies governing technical report content and format and instituted in-house training program for new technical staff. Selected prioritized and procured required support equipment. Actively managed Phase I and Phase II investigation and remediation projects. Reviewed assessment data, prepared feasibility studies, and evaluated remedial alternatives while preparing Remedial Action Plans (RAP) for fuel, heavy metal, and solvent-impacted sites. Prepared health-based risk assessment on large cleanup site adjacent to health care facility. Permitted, implemented, and successfully completed the first in-situ groundwater bioremediation system in Ventura County. Reviewed and implemented numerous Phase I and Phase II environmental site assessments throughout Central and Southern California.

2195 Faraday Avenue, Suite K ♦ Carlsbad, California 92008-7207 ♦ Ph: 760-431-3747 ♦ Fax: 760-431-3748 ♦ www.eeitiger.com

1989 TO 1991 Staff/Project Geologist
Nachant Environmental, Inc.
Planned, implemented, and managed environmental site investigations and remediation projects following appropriate regulatory and professional guidelines. Prepared and reviewed project cost proposals, correspondence, regulatory permits, assessment and investigation reports, and remedial action plans.

1987 TO 1989 Teaching Assistant
San Diego State University – Department of Geological Sciences and Department of Engineering

REPRESENTATIVE PROJECTS

Globe Mills, Sacramento CA - Conducted Phase I and Phase II environmental site assessment, evaluated environmental concerns for adaptive reuse project on behalf of Sacramento Housing and Redevelopment Agency. Managed and coordinated site cleanup, obtaining regulatory closure from the Sacramento County Environmental Management Division.

K Street Corridor – Sacramento, CA. Evaluated and conducted Phase I environmental site assessments on a multi-block area of downtown Sacramento, as well as a number of individual properties in other areas within the K Street Corridor, on behalf of the City of Sacramento Downtown Development Group.

Southside Garden and Fremont Mews, Sacramento, CA – Conducted Phase I/Phase II environmental site assessments and evaluated environmental concerns on three community garden projects on behalf of the Capitol Area Development Authority. Coordinated regulatory oversight with Sacramento County Environmental Management Division and the State Office of Environmental Health Hazard Assessment. Prepared an SAP and facilitated compliance with a Brownfield Grant from EPA Region 9. Prepared and evaluated RFP's from cleanup contractors and provided remediation oversight and management. Prepared closure documentation and obtained regulatory concurrence for both the Southside Garden and Fremont Mews projects.

Electronics Manufacturing Facility/Fueling Depot, Santa Monica, CA. Performed soil and groundwater investigation, feasibility testing and evaluation of fuel hydrocarbon and chlorinated solvent plumes. Prepared RAP with design criteria for soil vapor extraction. After approval of RAP by State regulators, implemented and successfully completed remediation at site, obtaining closure.

Former Aerospace Facility, Santa Ana, CA. Evaluated existing Phase I and Phase II assessments. Performed soil, soil vapor, and groundwater investigations of chlorinated solvent plumes at multiple locations on site. Modeled and evaluated potential plume source areas. Initiated site specific sampling protocol for chlorinated solvents. Negotiated with lead regulatory agency regarding regional contamination issues and site closure requirements.

Major Land Owner/Developer, San Juan Capistrano, CA. Conducted Phase I and Phase II environmental site assessments at multiple sites in southern Orange County. Evaluated potential environmental concerns related to sand & gravel operations, fueling facilities, ordinance testing facilities, aerospace engineering labs, vehicle maintenance and repair facilities, agricultural operations, and illicit dump sites.

Major Fast Food Restaurant Chain, Multiple Locations, CA. Conducted Phase I and Phase II environmental site assessments at multiple sites throughout California. Evaluated potential environmental concerns related to historic property uses and potential effects on site operations.

Todays Date: February 19, 2014

Property Address: Apn 473-160-004, Moreno Valley, CA 92555

In response to the application for a Policy of Title Insurance, Title365 Company hereby reports that it is prepared to issue, or cause to be issued, as of the date hereof, a Policy or Policies of Title Insurance describing the land and the estate or interest therein hereinafter set forth, insuring against loss which may be sustained by reason of any defect, lien or encumbrance not shown or referred to as an exception herein and/or not excluded from coverage pursuant to the printed Schedules, Conditions and Stipulations of said Policy forms.

The printed Exceptions and Exclusions from the coverage and Limitations on Covered Risks of said Policy or Policies of Title Insurance are set forth in Exhibit B attached. The policy to be issued may contain an arbitration clause. When the Amount of Insurance is less than that set forth in the arbitration clause, all arbitrable matters shall be arbitrated at the option of either the Company or the Insured as the exclusive remedy of the parties. Limitations on Covered Risks applicable to the CLTA and ALTA Homeowner's Policies of Title Insurance which establish a Deductible Amount and a Maximum Dollar Limit of Liability for certain coverages are also set forth in Exhibit B. Copies of the Policy forms should be read. They are available from the office which issued this report.

Please read the exceptions shown or referred to herein and the exceptions and exclusions set forth in Exhibit B of this report carefully. The exceptions and exclusions are meant to provide you with notice of matters which are not covered under the terms of the Policy or Policies of Title Insurance and should be carefully considered.

It is important to note that this preliminary report is not a written representation as to the condition of title and may not list all liens, defects and encumbrances affecting title to the land.

This report (and any supplements or amendments hereto) is issued solely for the purpose of facilitating the issuance of a Policy or Policies of Title Insurance and no liability is assumed hereby. If it is desired that liability be assumed prior to the issuance of a Policy or Policies of Title Insurance, a Binder or Commitment should be requested.

Dated as of February 13, 2014, at 07:30AM.

Sue Starr
Title Officer (E)
TU35@title365.com

The form of policy of title insurance contemplated by this report is:
CLTA Owners Policy (1/1/08) CLTA Standard Coverage Policy 1990 Underwritten by: First American Title Insurance Company

SCHEDULE A

The estate or interest in the land hereinafter described or referred to covered by this Report is:

A Fee

Title to said estate or interest at the date hereof is vested in:

Ironwood 8 Properties, a California Limited Partnership

The land referred to in this Report is situated in the County of Riverside, State of California, and is described as follows:

The South half of the Southwest quarter of Section 34, Township 2 South, Range 3 West, San Bernardino Meridian, County of Riverside, State of California, according to the Official Plat thereof.

Excepting therefrom that portion thereof within Ironwood Avenue.

Also excepting therefrom that portion described in deed to the County of Riverside recorded November 11, 1965 as Instrument No. 124978.

Except therefrom all oil, gas, minerals and other hydrocarbon substances, lying below a depth of 500 feet, without the right of surface entry.

APN: 473-160-004-5

SCHEDULE B

At the date hereof, Exceptions to coverage, in addition to the printed Exception and Exclusions contained in said policy form would be as follows:

1. Property taxes, which are a lien not yet due and payable, including any assessments collected with taxes, to be levied for the fiscal year 2014 - 2015 which are a lien not yet payable.

2. General and Special City and/or County taxes, including any personal property taxes and any assessments collected with taxes, for the fiscal year 2013 - 2014:
   1st Installment: $18,045.80 Paid
   Penalty: $1,804.58
   2nd Installment: $18,045.80 Open
   Penalty: $1,842.08
   Exemption: Not Set Out
   Code Area: 021-026
   Assessment No. 473-160-004-5

3. Assessments, if any, for community facility districts affecting said land which may exist by virtue of assessment maps or notices filed by said districts. Said assessments are collected with the County Taxes.

4. The lien of supplemental taxes, if any, assessed pursuant to the provisions of Chapter 3.5 (commencing with Section 75) of the revenue and taxation code of the State of California.

5. Reservations contained in the Patent from the United States of America recorded February 4, 1930, in Book 9, Page 431, Patents.

6. An easement for the purpose shown below and rights incidental thereto as set forth in a document:
   Purpose: Poles and other supports
   Recorded: April 24, 1934 in Book 169 and Page 434, of Official Records.
   Affects: A portion of said land

Notes and Requirements Section

Note 1: On July 1, 1985, Assembly Bill 3132 became effective. Assembly Bill 3132 adds and repeals portions of Sections 480.3 and 480.4 of the Revenue and Taxation Code of the State of California.

The act requires the County Assessor and/or Recorder to make available a statutorily prescribed form entitled "Preliminary Change of Ownership Report". Said report must be completed by the buyer and filed concurrently with the recordation of the documents evidencing the change of ownership. Failure to present the Change of Ownership Report at the time of recordation will cause the County Recorder to charge an additional $20.00 penalty recording fee. The fee cannot be charged if the transfer document is accompanied by the affidavit stating that the buyer/transferee is not a resident of the State of California. This report is for official use only and is not open to public inspection.

For further information, contact the Change of Ownership Section in the Assessor's Office located in the County of said property or the County Recorder's Office located in the County of said property.

Note 2: Attached are Privacy Policy Notices in compliance with the Gramm-Leach-Bliley Act (GLBA) effective July 1, 2001. Please review said Notices regarding personal information.

Note 3: The map attached hereto may or may not be a survey of the land depicted thereon. You should not rely upon it for any purpose other than orientation to the general location of the parcel or parcels depicted. This company expressly disclaims any liability for alleged loss or damage which may result from reliance upon this map.

Note 4: The RESPA Rule to simplify and improve of obtaining mortgages and reduce consumer settlement cost includes a provision for average charges, allowing settlement service providers to establish an average recording fee. The average recording charge for all residential refinance transactions is $93.00 and the average recording charge for all residential resale transactions with financing is $89.00. The average charge is applied regardless of the number of documents recorded in the transaction, the number of pages in each document or the actual recording charges. If your transaction is not a residential loan or sale with a new loan, please contact your title provider for actual recording charges. These average recording charges are subject to change in the future without notice.

Note 5: Part of the RESPA Rule to simply and improve the process of obtaining mortgages and reduce consumer settlement costs requires the settlement agent to disclose the agent and underwriter split of title premiums, including endorsements as follows:

> Line 1107 is used to record the amount of the total title insurance premium, including endorsements, that is retained by the title agent. Title365 Company retains 87% of the total premium and endorsements.
>
> Line 1108 is used to record the amount of the total title insurance premium, including endorsements, that is retained by the title underwriter. First American Title Insurance Company retains 13% of the total premium and endorsements.

Notice Regarding Your Deposit of Funds

California Insurance Code Sections 12413 *et. Seq*. Regulates the disbursement of escrow and sub-escrow funds by title companies. The law requires that funds be deposited in the title company escrow and sub-escrow accounts and be available for withdrawal prior to disbursement. Funds deposited with the Company by wire transfer may be disbursed upon receipt. Funds deposited w ith the Company via cashier's checks drawn on a California based bank may be disbursed the next business day after the day of deposit. If funds are deposited with by other methods, recording or disbursement may be delayed. All escrow and sub-escrow funds received by the Company w ill be deposited with other funds in one or more non-interest bearing escrow accounts of the Company in a financial institution selected by the Company. The Company and/or its parent company may receive certain direct or indirect benefits from the financial institution by reason of the deposit of such funds or the maintenance of such accounts with the financial institution, and the Company shall have no obligation to account to the depositing party in any manner for the value of, or to pay such party, any benefit received by the Company and/or its parent Company. Those benefits may include, without limitation, credits allowed by such financial institution on loans to the Company and/or its parent company and earnings on investments made on the proceeds of such loans, accounting, reporting and other services and products of such financial institution. Such benefits shall be deemed additional compensation of the Company for its services in connection with the escrow or sub-escrow. If funds are to be deposited with **Title365 Company** by wire transfer, they should be wired to the following bank/account:

PRIVACY POLICY NOTICE

We are committed to safeguarding customer information;

When we request information from you or about you, it is for our own legitimate business purposes and not for the benefit of any unaffiliated party;

We use personal consumer information only for legitimate business purposes in a manner consistent with title insurance and escrow practices in compliance with applicable laws and regulations;

We will obey the laws governing the collection, use, and dissemination of personal data; and

We will endeavor to educate our employees on the responsible collection and use of personal information.

PURPOSE OF THIS NOTICE

Title V of the Gramm-Leach-Bliley Act ("GLBA") generally requires a financial institution (which term includes title insurers, underwritten title companies and those providing real estate settlement services) to disclose to all its customers the privacy policies and practices with respect to information sharing of consumer nonpublic personal information with both affiliates and non-affiliated third parties. In compliance with GLBA, we are providing you with this document, which notifies you of the privacy policies and practices of Title365 Company This disclosure does not apply to business, commercial or agricultural transactions.

We may collect nonpublic personal information about you from the following sources:

- Information we receive from you, such as on applications or other forms.
- Information about your transactions we secure from our files, or from our affiliates or others.
- Information we receive from a consumer-reporting agency.
- Information we receive from others involved in y our transaction, such as the real estate agent, lender, survey or or appraiser.

Unless it is specifically stated otherwise in an amended Privacy Policy Notice, no additional nonpublic personal information will be collected about you.

We may disclose any of the above information that we collect about our customers or former customers to our affiliates or to non-affiliated third parties as permitted by law. This includes, but is not limited to, financial service providers (e.g., banks, consumer finance lenders, securities and insurance companies, etc.), non-financial companies (e.g., settlement or fulfillment service providers, or title plant operated by a third party vendor).

WE DO NOT DISCLOSE ANY NONPUBLIC PERSONAL INFORMATION ABOUT YOU WITH ANYONE FOR ANY PURPOSE THAT IS NOT SPECIFICALLY PERMITTED BY LAW.

EXHIBIT "A"

The South half of the Southwest quarter of Section 34, Township 2 South, Range 3 West, San Bernardino Meridian, County of Riverside, State of California, according to the Official Plat thereof.

Excepting therefrom that portion thereof within Ironwood Avenue.

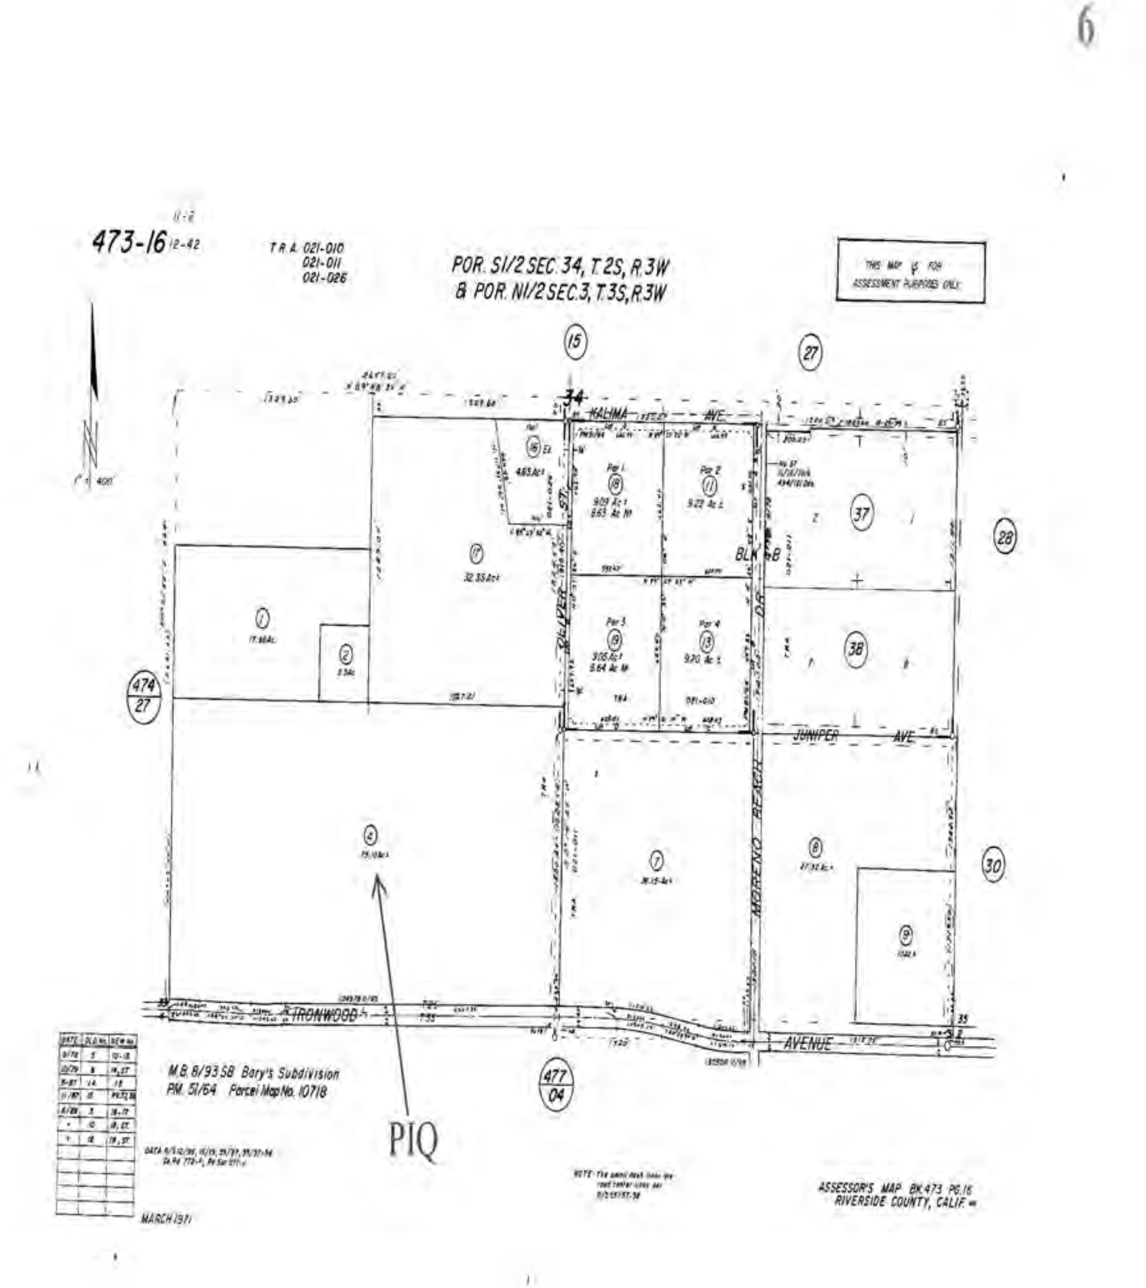
APN: 473-160-004-5



This map is for your aid in locating the subject property with reference to streets and other parcels. While this map is believed to be correct, Title365 Company. and subsequent insurance companies, assume no liability for any loss occurred by reason of reliance thereon.

EXHIBIT B (REVISED 11-17-06)

CALIFORNIA LAND TITLE ASSOCIATION STANDARD COVERAGE POLICY - 1990 EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:
1. (a) Any law, ordinance or governmental regulation (including but not limited to building or zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien, or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy. (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims or other matters: (a) whether or not recorded in the public records at Date of Policy, but created, suffered, assumed or agreed to by the insured claimant; (b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy; (c) resulting in no loss or damage to the insured claimant; (d) attaching or created subsequent to Date of Policy; or (e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the insured mortgage or for the estate or interest insured by this policy.
4. Unenforceability of the lien of the insured mortgage because of the inability or failure of the insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with the applicable doing business laws of the state in which the land is situated.
5. Invalidity or unenforceability of the lien of the insured mortgage, or claim thereof, which arises out of the transaction evidenced by the insured mortgage and is based upon usury or any consumer credit protection or truth in lending law.
6. Any claim, which arises out of the transaction vesting in the insured the estate of interest insured by this policy or the transaction creating the interest of the insured lender, by reason of the operation of federal bankruptcy, state insolvency or similar creditors' rights laws.

EXCEPTIONS FROM COVERAGE - SCHEDULE B, PART I

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:
1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown in the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

CLTA HOMEOWNER'S POLICY OF TITLE INSURANCE (10/22/03) ALTA HOMEOWNER'S POLICY OF TITLE INSURANCE EXCLUSIONS

In addition to the Exceptions in Schedule B, You are not insured against loss, costs, attorneys' fees, and expenses resulting from:
1. Governmental police power, and the existence or violation of any law or government regulation. This includes ordinances, laws and regulations concerning: a. building, b. zoning, c. Land use d. improvements on the Land, e. Land division, f. environmental protection. This Exclusion does not apply to violations or the enforcement of these matters if notice of the violation or enforcement appears in the Public Records at the Policy Date. This Exclusion does not limit the coverage described in Covered Risk 14, 15, 16, 17 or 24.
2. The failure of Your existing structures, or any part of them, to be constructed in accordance with applicable building codes. This Exclusion does not apply to violations of building codes if notice of the violation appears in the Public Records at the Policy Date.
3. The right to take the Land by condemning it, unless: a. a notice of exercising the right appears in the Public Records at the Policy Date; or b. the taking happened before the Policy Date and is binding on You if You bought the Land without Knowing of the taking.
4. Risks: a. that are created, allowed, or agreed to by You, whether or not they appear in the Public Records; b. that are Known to You at the Policy Date, but not to Us, unless they appear in the Public Records at the Policy Date; c. that result in no loss to You; or d. that first occur after the Policy Date - this does not limit the coverage described in Covered Risk 7, 8.d, 22, 23, 24 or 25.
5. Failure to pay value for Your Title.
6. Lack of a right: a. to any Land outside the area specifically described and referred to in paragraph 3 of Schedule A; and b. in streets, alleys, or waterways that touch the Land. This Exclusion does not limit the coverage described in Covered Risk 11 or 18.

LIMITATIONS ON COVERED RISKS

Your insurance for the following Covered Risks is limited on the Owner's Coverage Statement as follows:
• For Covered Risk 14, 15, 16 and 18, Your Deductible Amount and Our Maximum Dollar Limit of Liability shown in Schedule A.
The deductible amounts and maximum dollar limits shown on Schedule A are as follows:

	Your Deductible Amount	Our Maximum Dollar Limit of Liability
Covered Risk 14:	**1 % of Policy Amount or $2,500 (whichever is less)**	**$10,000**
Covered Risk 15:	**1 % of Policy Amount or $5,000 (whichever is less)**	**$25,000**
Covered Risk 16:	**1 % of Policy Amount or $5,000 (whichever is less)**	**$25,000**
Covered Risk 18:	**1 % of Policy Amount or $2,500 (whichever is less)**	**$5,000**

AMERICAN LAND TITLE ASSOCIATION RESIDENTIAL TITLE INSURANCE POLICY (6-1-87) EXCLUSIONS

In addition to the Exceptions in Schedule B, you are not insured against loss, costs, attorneys' fees, and expenses resulting from:
1. Governmental police power, and the existence or violation of any law or government regulation. This includes building and zoning ordinances and also laws and regulations concerning: * land use * improvements on the land * land division * environmental protection. This exclusion does not apply to violations or the enforcement of these matters which appear in the public records at Policy Date. This exclusion does not limit the zoning coverage described in Items 12 and 13 of Covered Title Risks.
2. The right to take the land by condemning it, unless: *a notice of exercising the right appears in the public records *on the Policy Date *the taking happened prior to the Policy Date and is binding on you if you bought the land without knowing of the taking
3. Title Risks: *that are created, allowed, or agreed to by you *that are known to you, but not to us, on the Policy Date -- unless they appeared in the public records *that result in no loss to you *that first affect your title after the Policy Date -- this does not limit the labor and material lien coverage in Item 8 of Covered Title Risks
4. Failure to pay value for your title.
5. Lack of a right: *to any land outside the area specifically described and referred to in Item 3 of Schedule A OR *in streets, alleys, or waterways that touch your land. This exclusion does not limit the access coverage in Item 5 of Covered Title Risks.

ALTA LOAN POLICY (10-17-92) WITH ALTA ENDORSEMENT-FORM 1 COVERAGE EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:
1. (a) Any law, ordinance or governmental regulation (including but not limited to building and zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating to (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy. (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims or other matters:(a)created, suffered, assumed or agreed to by the insured claimant; (b)not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy; (c) resulting in no loss or damage to the insured claimant; (d) attaching or created subsequent to Date of Policy (except to the extent that this policy insures the priority of the lien of the insured mortgage over any statutory lien for services, labor or material or to the extent insurance is afforded herein as to assessments for street improvements under construction or completed at Date of Policy);or(e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the insured mortgage.
4. Unenforceability of the lien of the insured mortgage because of the inability or failure of the insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with applicable doing business laws of the state in which the land is situated.
5. Invalidity or unenforceability of the lien of the insured mortgage, or claim thereof, which arises out of the transaction evidenced by the insured mortgage and is based upon usury or any consumer credit protection or truth in lending law.
6. Any statutory lien for services, labor or materials (or the claim of priority of any statutory lien for services, labor or materials over the lien of the insured mortgage) arising from an improvement or work related tothe land which is contracted for and commenced subsequent to Date of Policy and is not financed in whole or in part by proceeds of the indebtedness secured by the insured mortgage which at Date of Policy the insured has advanced or is obligated to advance.
7. Any claim, which arises out of the transaction creating the interest of the mortgagee insured by this policy, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that is based on: (i) the transaction creating the interest of the insured mortgagee being deemed a fraudulent conveyance or fraudulent transfer; or(ii) the subordination of the interest of the insured mortgagee as a result of the application of the doctrine or equitable subordination; or(iii) the transaction creating the interest of the insured mortgagee being deemed a preferential transfer except where the preferential transfer results from the failure:(a)to timely record the instrument of transfer; or(b) of such recordation to impart notice to a purchaser for value or a judgement or lien creditor. The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:
1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown in the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

2006 ALTA LOAN POLICY (06-17-06) EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:
1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to: (i) the occupancy, use, or enjoyment of the Land; (ii) the character, dimensions, or location of any improvement erected on the Land; (iii) the subdivision of land; or (IV) environmental protection; or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5. (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters: (a) created, suffered, assumed, or agreed to by the Insured Claimant; (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;(c) resulting in no loss or damage to the Insured Claimant; (d) attaching or

created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13, or 14); or (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is: (a) a fraudulent conveyance or fraudulent transfer, or (b) a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records.
This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b). The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) that arise by reason of:
1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown in the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

ALTA OWNER'S POLICY (10-17-92) EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:
1. (a) Any law, ordinance or governmental regulation (including but not limited to building and zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating to (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy. (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims or other matters: (a) created, suffered, assumed or agreed to by the insured claimant;(b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy;(c)resulting in no loss or damage to the insured claimant; (d) attaching or created subsequent to Date of Policy; or(e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the estate or interest insured by this policy.
4. Any claim, which arises out of the transaction vesting in the insured the estate or interest insured by this policy, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that is based on: (i) the transaction creating the estate or interest insured by this policy being deemed a fraudulent conveyance or fraudulent transfer; or (ii) the transaction creating the estate or interest insured by this policy being deemed a preferential transfer except where the preferential transfer results from the failure: (a) to timely record the instrument of transfer; or (b) of such recordation to impart notice to a purchaser for value or a judgement or lien creditor. The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage Policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:
1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown in the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

2006 ALTA OWNER'S POLICY (06-17-06) EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:
1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to (i) the occupancy, use, or enjoyment of the Land; (ii) the character, dimensions, or location of any improvement erected on the Land; (iii) the subdivision of land; or (iv) environmental protection; or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a)does not modify or limit the coverage provided under Covered Risk 5. (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters (a) created, suffered, assumed, or agreed to by the Insured Claimant; (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy; (c) resulting in no loss or damage to the Insured Claimant; (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 9 and 10); or (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Title.
4. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction vesting the Title as shown in Schedule A, is (a) a fraudulent conveyance or fraudulent transfer; or (b) a preferential transfer for any reason not stated in Covered Risk 9 of this policy.
5. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the deed or other instrument of transfer in the Public Records that vests Title as shown in Schedule A. The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) that arise by reason of:
1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown in the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

ALTA EXPANDED COVERAGE RESIDENTIAL LOAN POLICY (10/13/01)EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys fees or expenses which arise by reason of:
1. (a) Any law, ordinance or governmental regulation (including but not limited to building and zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating to (i) the occupancy, use, or enjoyment of the Land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the Land; (iii) a separation in ownership or a change in the dimensions or areas of the Land or any parcel of which the Land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that s notice of the enforcement thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the Land has been recorded in the Public Records at Date of Policy. This exclusion does not limit the coverage provided under Covered Risks 12, 13, 14, and 16 of this policy.(b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or a notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the Land has been recorded in the Public Records at Date of Policy. This exclusion does not limit the coverage provided under Covered Risks 12, 13, 14, and 16 of this policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the Public Records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without Knowledge.
3.Defects, liens, encumbrances, adverse claims or other matters:(a) created, suffered, assumed or agreed to by the Insured Claimant; (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;(c) resulting In no loss or damage to the Insured Claimant;(d) attaching or created subsequent to Date of Policy (this paragraph does not limit the coverage provided under Covered Risks 8, 16, 18, 19, 20, 21, 22, 23, 24, 25 and 26); or(e)resulting in loss or damage which would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of the Insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with applicable doing business laws of the state in which the Land is situated.
5. Invalidity or unenforceability of the lien of the Insured Mortgage, or claim thereof, which arises out of the transaction evidenced by the Insured Mortgage and is based upon usury, except as provided in Covered Risk 27, or any consumer credit protection or truth in lending law.
6. Real property taxes or assessments of any governmental authority which become a lien on the Land subsequent to Date of Policy. This exclusion does not limit the coverage provided under Covered Risks 7, 8(e) and 26.
7. Any claim of invalidity, unenforceability or lack of priority of the lien of the Insured Mortgage as to advances or modifications made after the Insured has Knowledge that the vestee shown in Schedule A is no longer the owner of the estate or interest covered by this policy. This exclusion does not limit the coverage provided in Covered Risk 8.
8.Lack of priority of the lien of the Insured Mortgage as to each and every advance made after Date of Policy, and all interest charged thereon, over liens, encumbrances and other matters affecting the title, the existence of which are Known to the Insured at:(a) The time of the advance; or(b) The time a modification is made to the terms of the Insured Mortgage which changes the rate of interest charged, if the rate of Interest is greater as a result of the modification than it would have been before the modification. This exclusion does not limit the coverage provided in Covered Risk 8.
9. The failure of the residential structure, or any portion thereof to have been constructed before, on or after Date of Policy in accordance with applicable building codes. This exclusion does not apply to violations of building codes if notice of the violation appears in the Public Records at Date of Policy.

DOCUMENTARY TRANSFER TAX AFFIDAVIT

WARNING

ANY PERSON WHO MAKES ANY MATERIAL MISREPRESENTATION OF FACT FOR THE PURPOSE OF AVOIDING ALL OR ANY PART OF THE DOCUMENTARY TRANSFER TAX IS GUILTY OF A MISDEMEANOR UNDER SECTION 5 OF ORDINANCE 516 OF THE COUNTY OF RIVERSIDE AND IS SUBJECT TO PROSECUTION FOR SUCH OFFENSE.

ASSESSOR'S PARCEL NO. _____--_____--_____
Property Address: ____________________________

I declare that the documentary transfer tax for this transaction is: $_______________.

If this transaction is exempt from Documentary Transfer Tax, the reason must be identified below.

I CLAIM THAT THIS TRANSACTION IS EXEMPT FROM DOCUMENTARY TRANSFER TAX BECAUSE: (The Sections listed below are taken from the Revenue and Taxation Code. Please check one or explain in "Other".)

1. ___ Section 11911. The document is a lease for a term of **less** than thirty-five (35) years (including options).
2. ___ Section 11911. The easement is **not** perpetual, permanent, or for life.
3. ___ Section 11921. The instrument was given to secure a debt.
4. ___ Section 11922. The conveyance is to a governmental entity or political subdivision.
5. ___ Section 11925. The transfer is between individuals and a legal entity, or between legal entities, and does not change the proportional interests held.
6. ___ Section 11926. The instrument is from a trustor to a beneficiary, in lieu of foreclosure, and no additional consideration was paid.
7. ___ Section 11926. The grantee is the foreclosing beneficiary and the consideration paid by the foreclosing beneficiary does not exceed the unpaid debt.
8. ___ Section 11927. The conveyance relates to a dissolution of marriage or legal separation.
9. ___ Section 11930. The conveyance is an *inter vivos* gift* or a transfer by death.
   ***Please be aware that information stated on this document may be given to and used by governmental agencies, including the Internal Reveue Service. Also, certain gifts in excess of the annual Federal gift tax exemption may trigger a Federal Gift Tax. In such cases, the Transferor (donor/grantor) may be required to file Form 709 (Federal Gift Tax Return) with the Internal Revenue Service.**
10. ___ Section 11930. The conveyance is to the grantor's revocable living trust.
11. ___ Other) Include explanation and authority) ____
    ____
    ____

I DECLARE UNDER PENALTY OF PERJURY THAT THE FOREGOING IS TRUE AND CORRECT.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Inquiry # 4092958.3	Contact: Polly Ivers

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by EEI, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Sanborn® Library search results
Certification # 4F27-4246-B3EC

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ✔ Library of Congress
- ✔ University Publications of America
- ✔ EDR Private Collection

The Sanborn Library LLC Since 1866™

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Limited Permission To Make Copies

EEI, Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: A review of the SWF/LF list, as provided by EDR, and dated 05/19/2014 has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
BADLANDS SANITARY LA	***31125 IRONWOOD AVENU***	***W 1/4 - 1/2 (0.342 mi.)***	***A2***	***8***

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Landfill / Solid Waste Disposal Sites

WMUDS/SWAT: A review of the WMUDS/SWAT list, as provided by EDR, and dated 04/01/2000 has revealed that there is 1 WMUDS/SWAT site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
RIV CO., WASTE MGMT,	***31125 IRONWOOD AVE***	***W 1/4 - 1/2 (0.342 mi.)***	***A1***	***8***

Count: 13 records.

TARGET PROPERTY ADDRESS

NW IRONWOOD AVE AND OLIVER ST
NW IRONWOOD AVE AND OLIVER ST
MORENO VALLEY, CA 92555

TARGET PROPERTY COORDINATES

Latitude (North):	33.9483 - 33˚ 56’ 53.88’’
Longitude (West):	117.187 - 117˚ 11’ 13.20’’
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	482720.1
UTM Y (Meters):	3756245.0
Elevation:	1865 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	33117-H2 SUNNYMEAD, CA
Most Recent Revision:	1980

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

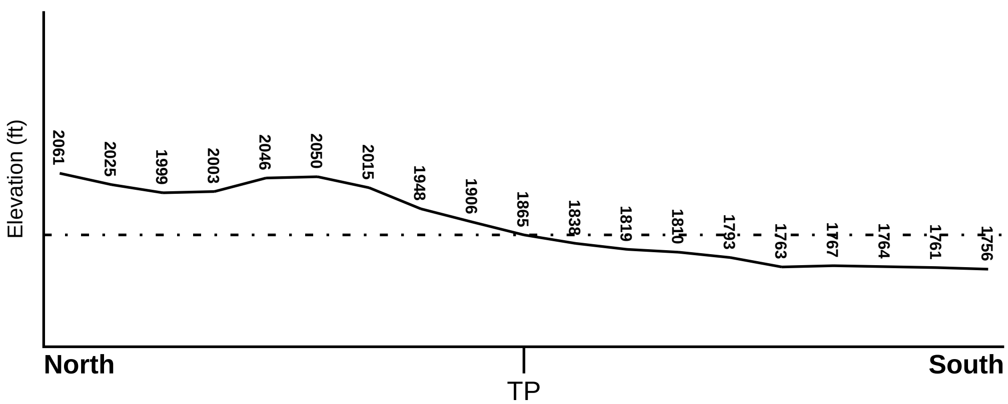
TOPOGRAPHIC INFORMATION

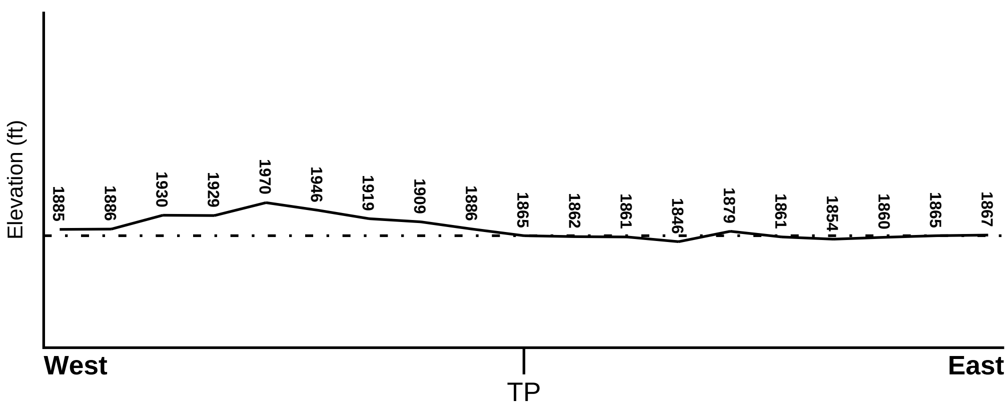
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 1865 ft.

0 1/2 1 Miles

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
RIVERSIDE, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06065C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Mesozoic
System: Cretaceous
Series: Cretaceous granitic rocks

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Terrace escarpments

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 5.6
2	7 inches	40 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 5.6
3	40 inches	59 inches	stratified loamy sand to coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6

Soil Map ID: 3

Soil Component Name: MONSERATE

Soil Surface Texture: sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		Soil Reaction (pH)
1	0 inches	9 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 7.3 Min: 6.1
2	9 inches	27 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 7.3 Min: 6.1
3	27 inches	44 inches	indurated	Not reported	Not reported	Max: 0.01 Min: 0	Max: Min:
4	44 inches	57 inches	cemented	Not reported	Not reported	Max: 0.01 Min: 0	Max: Min:
5	57 inches	70 inches	loamy coarse sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 8.4 Min: 6.6

Soil Map ID: 4

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5’ Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5’ Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5’ Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW[R] Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture’s (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

STREET AND ADDRESS INFORMATION

APPENDIX E
USER PROVIDED INFORMATION

EEI
Geotechnical & Environmental Solutions

ASTM E1527-13
USER SPECIFIC QUESTIONNAIRE

Project Name: **EEI Job No.: GLO-71982.1 / Undeveloped Property – 80-Acres**

Project Address: **NWC Ironwood Ave. and Oliver St., Moreno Valley, Riverside County CA 92555**

In order to comply with the ASTM E1527-13 Standard and qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"), the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete. Please provide the following information (if available). Your answers will be incorporated into the final Phase I ESA under the section "User-supplied Information."

(1.) Environmental cleanup liens that are filed or recorded against the property (40 CFR 312.25).
Did a search of *recorded land title records* (or judicial records where appropriate, see NOTE below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law? (NOTE - In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

No.

(2.) Activity and land use limitations (AULs) that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).
Did a search of *recorded land title records* (or judicial records where appropriate, see NOTE above) identify any AULs, such as *engineering controls*, land use restrictions, or *institutional controls* that are in place at the *property* and/or have been filed or recorded against the *property* under federal, tribal, state or local law?

No.

(3.) Specialized knowledge or experience of the person seeking to qualify for the Landowner Liability Protections (LLP - 40 CFR 312.28).
As the *user* of this *ESA* do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an adjoining *property* so that you would have specialized knowledge of the chemicals and processes used by this type of business? (self-explanatory)

No.

(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).
Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

Yes.

(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).
Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases? For example, as *user*,

(a.) Do you know the past uses of the *property*?

No.

(b.) Do you know of specific chemicals that are present or once were present at the *property*?

No.

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?

No.

(d.) Do you know of any environmental cleanups that have taken place at the *property*?

No.

(6.) The degree of obviousness of the presence of likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).
As the *user* of this *ESA*, based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of contamination at the *property*?

No.

In addition, certain information should be collected, if available, and provided to the e*nvironmental professional* selected to conduct the Phase I. This information is intended to assist the *environmental professional* but is not necessarily required to qualify for one of the *LLPs*. The information includes:

(a) the <u>reason</u> why the Phase I is required,

The city of Moreno Valley needs a phase 1 to process our map.

(b) the <u>type</u> of *property* and type of *property* transaction, for example, sale, purchase, exchange, etc.,

Type of property transaction: SALE

(c) the <u>complete and correct address</u> for the *property* (a map or other documentation showing *property* location and boundaries is helpful),

Legal description

The South half of the Southwest quarter of Section 34, Township 2 South, Range 3 West, San Bernardino Meridian, County of Riverside, State of California, according to the Official Plat thereof. Excepting herefrom that portion thereof within Ironwood Avenue.

Also excepting therefrom that portion described in deed to the County of Riverside recorded November 11, 1965 as Instrument No. 124978.

Except therefrom all oil, gas, minerals and other hydrocarbon substances, lying below a depth of 500 feet, without the right of surface entry.
APN: 473-160-004-5

Please see attached map also.

(d) the scope of services desired for the Phase I (including whether any parties to the *property* transaction may have a required standard scope of services on whether any considerations beyond the requirements of Practice E 1527 are to be considered),

No.

(e) identification of all parties who will rely on the Phase I *report*,

The City of Moreno Valley, Global Investments and Development, All the future residents of the property, and all the other governmental agencies that have to decide on the fate of the project.

(f) identification of the site contact and how the contact can be reached,

Joseph Rivani : (213)-365-0005
jrivani@gidllco.com

(g) any special terms and conditions which must be agreed upon by the *environmental professional*, and

No.

(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition).

No.

OWNER/LANDLORD/OCCUPANT INTERVIEW QUESTIONS

Project Name: **EEI Job No.: GLO-71982.1 / Undeveloped Property – 80-Acres**

Project Address: **NWC Ironwood Ave. and Oliver St., Moreno Valley, Riverside County CA 92555**

1. What is/are the Current Use(s) of the Property, to the best of your knowledge?

The property is not in any kind of use.

2. What was/were the Past Use(s) of the Property, to the best of your knowledge?

The property has not been in use since purchase.

3. Are there now or were there ever present any aboveground storage tanks, underground storage tanks or vent pipes, fill pipes or accessways indicating underground storage tanks?

Not to the best of our knowledge were there any aboveground storage tanks, underground storage tanks or vent pipes, fill pipes or accessways indicating underground storage tanks.

4. Are there any areas of the site with strong, pungent, or noxious odors?

There are no strong, pungent or noxious odors in any areas of the site.

5. Are there any areas of standing surface water, including Pools or sumps?

There is no standing surface water on the site.

6. Are there any Hazardous Substances and/or Petroleum Product Containers currently stored on site?

There are no hazardous substances and/or petroleum product containers stored on site.

7. Are there any unlabelled Drums or any Unidentified Substance Containers stored on the property?

There are no unlabeled drums and/or any unidentified substance containers stored on the site.

8. Is there any Electrical or hydraulic equipment known to contain PCBs or likely to contain PCBs?

There is no electrical or hydraulic equipment known to contain PCBs or likely to contain PCBs.

9. Do you know of any spills or other chemical releases that have taken place at the property?

We are not aware of any spills or other chemical releases ever taken place on this site.

10. Do you know of any environmental cleanups that have taken place at the property?

We are not aware of any environmental cleanups taken place on this site.

11. Are you aware of any deed restrictions or other activity or land use restrictions that have been placed on the property as a result of an environmental issue?

We are not aware of any restrictions or other activity or land use restrictions that have been placed on this site as a result of an environmental issue.

12. Are you aware of any environmental liens, unresolved notices of violation, or litigation related to a contamination issue at the property?

We are not aware of any environmental liens, unresolved notices of violation or litigation related to a contamination issue on this site.

13. Are you aware of any previous assessments conducted at the subject property?

An environmental impact assessment was done by the City of Moreno Valley as a part of its feasibility study to use this site for a new high school. No negative finding was resulted.

Attention: Ms. Amber Caudill

Subject: Phase I Environmental Site Assessment Report Proposed Alternate High School No. 5 – Ironwood/Nason, Moreno Valley, California

Dear Ms. Caudill:

Enclosed please find one copy of the Phase I Environmental Site Assessment (Phase I) report for the Proposed Alternate High School No. 5 – Ironwood/Nason located in Moreno Valley, California. Based on the results of this assessment, no recognized environmental conditions (RECs), historical RECs, or known environmental conditions associated with the subject site were identified. No further assessment or investigation is recommended.

Sincerely yours,
THE PLANNING CENTER

Executive Summary

The Planning Center has performed a Phase I Environmental Site Assessment (Phase I) on behalf of the Moreno Valley Unified School District (District) for the construction of a high school on an approximately 75.1-acre parcel of vacant land located at the northeast corner of Ironwood Avenue and Nason Street in the City of Moreno Valley, Riverside County, California. The scope of work is described and conditioned by our proposal dated April 15, 2008. As indicated in our proposal, this Phase I was performed in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) E 1527-05 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, and following the California Environmental Protection Agency Department of Toxic Substances Control (DTSC) guidelines for Phase 1 evaluations for proposed school sites. Exceptions to, or deletions from, this practice are described in Section 1 of this report. Our conclusions are intended to help the user evaluate the "environmental risk" associated with the site, as defined in the ASTM E 1527-05 Standard and discussed in the Introduction section of this report.

RECOGNIZED ENVIRONMENTAL CONDITIONS

The goal of the ASTM E 1527-05 Standard practice is to identify Recognized Environmental Conditions (RECs), as defined in the Standard and in Section 1 of this report

This assessment has revealed no evidence of RECs in connection with the property as defined in the Standard and in Section 1 of this report and DTSC recommended school guidance for Phase I Environmental Site Assessments.

HISTORICAL RECS AND KNOWN OR SUSPECT ENVIRONMENTAL CONDITIONS

The ASTM E 1527-05 Standard also requires identification of historical RECs (HRECs) and other known or suspect environmental conditions, as defined in the Standard, and in Section 1 of this Phase I report.

This assessment has revealed no evidence of HRECs or known environmental conditions in connection with the subject site.

SUMMARY

Based on the results of this assessment, RECs, HRECs, and known environmental conditions associated with the subject site were not identified. No further assessment or investigation is recommended.

The remainder of this report contains additional information regarding the Phase I work performed, the findings summarized above, and any limitations.

This page intentionally left blank

1. Introduction

PURPOSE

This Phase I Environmental Site Assessment (Phase I) was performed in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) E 1527-05 Standard and following the California Environmental Protection Agency Department of Toxic Substances Control (DTSC) recommended guidelines for Phase 1 evaluations for school sites (DTSC 2001). The proposed school site is being evaluated by the District for the construction of a high school on an approximately 75.1-acre parcel of vacant land. The site is located at the northeast corner of Ironwood Avenue and Nason Street in the City of Moreno Valley, Riverside County, California (Figure 1).

The purpose of this assessment was to evaluate site history, existing observable conditions, current site use, and current and historic uses of surrounding properties to identify the potential presence of Recognized Environmental Conditions (RECs) in connection with the subject site. RECs are defined by ASTM as "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on a property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions."

In addition, the Standard requires the identification of historical RECs (HRECs) and known or suspect environmental conditions in the Phase I report. The standard defines historical RECs as environmental conditions "which in the past would have been considered a recognized environmental condition, but which may or may not be considered a recognized environmental condition currently." The term "known or suspect environmental condition" is not specifically defined in the standard, but is used by The Planning Center to highlight environmentally-related information that is not anticipated to adversely affect the subject site and/or does not rise to the level of an REC.

Our conclusions are intended to help the user evaluate the "environmental risk" associated with the site, defined by ASTM as "a risk which can have a material environmental or environmentally-driven financial impact on the business associated with the current or planned use of a parcel of commercial real estate. Consideration of environmental risk issues may involve addressing one or more non-scope considerations."

SITE IDENTIFICATION

The approximately 75.1-acre site is located at located at the northeast corner of Ironwood Avenue and Nason Street in the City of Moreno Valley, Riverside County, California. The District is planning to construct a high school on an approximately 75.1-acre area of vacant land. The site is generally located north of Ironwood Avenue between Oliver Street and Nason Street. The project site consists of Assessor's Parcel Number (APN) 473-160-004-5. The project site and surrounding area are depicted on Figure 2.

DETAILED SCOPE OF SERVICES

The Planning Center performed the following detailed scope of services to complete our Phase I assessment:

1. Introduction

1. Visual observations of site conditions, and of adjoining property use, to evaluate the nature and type of activities that have been or are being conducted at and adjacent to the site, in terms of the potential for release or threat of release of hazardous substances or petroleum products.

2. Review of federal and state environmental database information within the ASTM- specified radii from the subject site using a database service to access records. Use of 7 5-minute topographic maps to evaluate the site's physical setting.

3. Review of federal and state environmental files pertaining to the subject site and nearby sites with the potential to impact the subject site.

4. Review of previous reports (if any) prepared for the subject site.

5. Review of the following sources of historical use information:

   - Aerial Photographs
   - Historical Topographic Maps

6. Contacts with state and local agencies regarding the site and surrounding properties and structures.

7. Interviews with the Key Site Manager and property tenant representatives (if any).

8. Interpretation of information and data assembled as a result of the above work tasks, and formulation of conclusions regarding the potential presence and impact of RECs as defined by the ASTM E 1527-05 Standard

NON-SCOPE CONSIDERATIONS

The ASTM E 1527-05 Standard includes the following list of "additional issues" that are non-scope considerations outside of the scope of the ASTM Phase I practice: Asbestos-Containing Materials, Radon, Lead-Based Paint, Lead in Drinking Water, Wetlands, Regulatory Compliance, Cultural and Historic Risks, Industrial Hygiene, Health and Safety, Ecological Resources, Endangered Species, Indoor Air Quality, and High Voltage Power Lines. The additional issues included in this Phase I include the following:

- A review of agency records to identify high-pressure gas lines and fuel transmission lines in the vicinity of the subject site;
- A review of Division of Oil and Gas records;
- A review of geological references for the presence of naturally occurring asbestos;
- The use of fill material on the subject site;
- Prior usage of subject site for agricultural purposes, mining activities, illegal drug manufacturing and disposal, and U.S. Government ownership; and
- The possibility of lead-based paint used in building construction.

EXCEPTIONS AND DEVIATIONS

1.5.1 Exceptions

The Planning Center has completed this assessment in substantial conformance with ASTM E 1527-05. In our opinion, there were no exceptions made to the ASTM work scope. The Planning Center also included additional information that the DTSC has indicated as being of potential concern for school sites (DTSC 2001)

1.5.2 Deviations

The Planning Center completed this assessment in substantial conformance with the ASTM E 1527-05 Standard. In our opinion there were no deviations and deletions made from the ASTM work scope in completing this Phase I.

LIMITATIONS

Our work for this project was performed generally consistent with the ASTM E 1527-05 Standard for Phase I Environmental Site Assessments. Several organizations other than ASTM, such as professional associations (e g. ASFE and AGWSE) have also developed "guidelines" or "standards" for environmental site assessments. The Phase I presented herein is consistent with the ASTM E 1527-05 Standard, which may vary from the specific "guidelines" or "standards" required by other organizations

This Report was prepared pursuant to an Agreement dated April 15, 2008 between the District and The Planning Center. All uses of this Report are subject to, and deemed acceptance of, the conditions and restrictions contained in the Agreement. The observations and conclusions described in this Report are based solely on the Scope of Services provided pursuant to the Agreement. The Planning Center has not performed any additional observations, investigations, studies or other testing not specified in the Agreement. The Planning Center shall not be liable for the existence of any condition the discovery of which would have required the performance of services not authorized under the Agreement.

This Report is prepared for the exclusive use of the District in connection with the site located at the northeast corner of Ironwood Avenue and Nason Street in the City of Moreno Valley, Riverside County, California. There are no intended beneficiaries other than the District. The Planning Center shall owe no duty whatsoever to any other person or entity on account of the Agreement or the Report. Use of this Report by any person or entity other than the District for any purpose whatsoever is expressly forbidden unless such other person or entity obtains written authorization from the District and from The Planning Center. Use of this Report by such other person or entity without the written authorization of the District and The Planning Center shall be at such other person's or entity's sole risk, and shall be without legal exposure or liability to The Planning Center.

Use of this Report by any person or entity, including by the District, for a purpose other than the site located at the northeast corner of Ironwood Avenue and Nason Street in the City of Moreno Valley, Riverside County, California, is expressly prohibited unless such person or entity obtains written authorization from The Planning Center indicating that the Report is adequate for such other use. Use of this Report by any person or entity for such other purpose without written authorization by The Planning Center shall be at such person's or entity's sole risk and shall be without legal exposure or liability to The Planning Center.

This Report reflects site conditions observed and described by records available to The Planning Center as of the date of report preparation The passage of time may result in significant changes in site conditions, technology, or economic conditions, which could alter the findings and/or recommendations of the report. Accordingly, the District and any other party to whom the report is provided recognize and agree that The Planning Center shall bear no liability for deviations from observed conditions or available records after the time of report preparation.

Use of this Report by any person or entity in violation of the restrictions expressed in this Report shall be deemed and accepted by the user as conclusive evidence that such use and the reliance placed on this Report, or any portions thereof, is unreasonable, and that the user accepts full and exclusive responsibility and liability for any losses, damages or other liability which may result.

2. Site Description

SITE OWNERSHIP AND LOCATION

2.1.1 Name of Site Owner

The name of the site owner is unknown. However, the site owner can be contacted through the following intermediary:

Chang Chung Yang
260 W. Las Flores Avenue
Arcadia, CA 91007

2.1.2 Name of Site Operator

The site is currently vacant land. No site operator has been identified by the District.

2.1.3 Site Location Map

The United States Geological Survey (USGS) topographic map for the site is the 7.5-minute Topographic Series, Sunnymead, California Quadrangle (see Appendix A). The USGS topographic map was used as the source for site setting information. The site is located in Riverside County at 33.9486° north latitude and 117 1864° west longitude.

SITE AND VICINITY DESCRIPTION

The following is a description of the proposed school site and surrounding area:

- The subject site is approximately 75 1 acres in size.
- The site currently consists of vacant land (Figure 2)
- Property around the perimeter of the Site is currently zoned for residential use based on a review of the City of Moreno Valley, General Plan Land Use Map.
- The area in the vicinity of the subject site is generally characterized as a mixed vacant land, residential, and commercial use area.

PHYSICAL SETTING

Subsurface explorations were not performed for this evaluation; therefore site geology and hydrology were evaluated on the basis of readily-available public information or references.

2.3.1 Topography

Topographically, most of the site is gently sloping to the south, although a relatively steep hill is located in the northwest portion and hummocky terrain exists in the central portion. Based on a review of the USGS 7.5-minute Topographic Series, Sunnymead, California Quadrangle Map (USGS 1980), surface elevation of the subject site ranges between approximately 1,830 to 2,040 feet above mean sea level (msl).

2.3.2 Geologic Information

The site is located in the northern highlands of Moreno Valley within the Perris Structural Block, part of the Peninsular Ranges Geomorphic Province. The Peninsular Ranges Province extends approximately 900 miles from the Los Angeles-Pomona-San Bernardino Basins to Baja California, Mexico and is characterized by elongated northwest-trending mountain ranges separated by sediment-floored valleys (Yerkes *et al.* 1965). The most dominant structural features of the province are the northwest-trending fault zones, most of which die out, merge with, or are terminated by the steep reverse faults at the southern margin of the San Gabriel-San Bernardino Mountains within the Transverse Ranges Geomorphic Province far to the north of the Site. The property itself sits atop the Perris structural block, which lies between the Elsinore and San Jacinto faults. Most of the property sits atop Holocene and late Pleistocene young sandy axial channel deposits and early Pleistocene very old sandy alluvial fan deposits, although the northwest portion of the site has outcrops of Cretaceous biotite-hornblende tonalite (Morton and Matti 2001).

Our review of available in-house literature indicates that no active faults or fault traces are known to exist beneath the subject site.

2.3.3 Naturally Occurring Asbestos Containing Minerals

According to the California Division of Mines and Geology (CDMG), no naturally-occurring serpentine rock or rock formations that may contain a significant quantity of asbestos are located in the site vicinity (CDMG 2000).

2.3.4 Ground Water and Surface Water Information

Based on surface topography, surface water at the site generally flows to the south. The groundwater flow would be expected to follow the topographic gradient to the closest water body. An unnamed ephemeral wash is present on the central portion of the site. Hydrogeologic investigations were not performed on the site for this investigation; therefore, it is unknown to what extent localized variations in groundwater presence and flow occur on the site.

Sheet flow runoff from the site during periods of intense or prolonged precipitation would be expected to flow towards the south. According to the Federal Emergency Management Agency [FEMA] online map information (FIRM 1987), the site is located within Zone X, outside of a 100- or 500-year flood zone.

The subject site is located on alluvium with relatively shallow bedrock north of the Perris North Subbasin of the San Jacinto Groundwater Basin. Groundwater in the San Jacinto Groundwater Basin flows generally toward the course of the San Jacinto River and westward out of the basin, however, high extraction rates have produced groundwater depressions and locally reversed the flow pattern. Primary recharge in this basin occurs from percolation of flow from the San Jacinto River and its tributary streams and from infiltration of rainfall on the valley floor. Based on subsurface bedrock topography, the flow direction is expected to be toward the southeast (Wildermuth 2000). According to Wildermuth (2000), the bedrock is shallow on the site, so transient groundwater may exist in alluvium following significant rainfall events

3. *Previous Reports*

No previous reports have been provided or prepared for the subject Site.

3. Previous Reports

This page intentionally left blank

4. Site History

4.1 PAST USAGE OF THE SITE

Past usage of the site was assessed through a review of aerial photographs and historical topographic maps. Copies of historical references reviewed are included in Appendix A.

According to historical aerial photographs and topographic maps, the site has been vacant undeveloped land since at least 1901.

4.1.1 Aerial Photographs

Aerial photographs were obtained from Environmental Data Resources (EDR) for the years 1938, 1953, 1967, 1980, 1989, 1994, 2002 and 2005 and were reviewed for the subject site. Copies of the aerial photographs are included in Appendix A

- 1938 – The subject site is vacant undeveloped land.
- 1953 – The subject site appears relatively unchanged in comparison to the 1938 aerial photograph.
- 1967 – The subject site appears relatively unchanged in comparison to the 1953 aerial photograph.
- 1980 – The subject site appears relatively unchanged in comparison to the 1967 aerial photograph.
- 1989 – The subject site appears relatively unchanged in comparison to the 1980 aerial photograph.
- 1994 – The subject site appears relatively unchanged in comparison to the 1989 aerial photograph.
- 2002 – The subject site appears relatively unchanged in comparison to the 1994 aerial photograph.
- 2005 – The subject site appears relatively unchanged in comparison to the 2002 aerial photograph

4.1.2 Historical Topographic Maps

Historical topographic maps were obtained from EDR for the years 1901, 1943, 1953, 1967 and 1980 were reviewed for the subject site. Copies of the topographic maps are included in Appendix A.

- 1901 – The site appears to be vacant and no structures are depicted.
- 1943 – The subject site is unchanged in comparison to the 1901 topographic map.
- 1953 – The subject site is unchanged in comparison to the 1943 topographic map
- 1967 – The subject site is unchanged in comparison to the 1953 topographic map.
- 1980 – The subject site is unchanged in comparison to the 1967 topographic map

4. Site History

4.1.3 Prior Agricultural Use

Based on the site visit, file reviews, and the review of aerial photographs and historic topographic maps, the subject site does not appear to have been used for agricultural purposes. According to historical aerial photographs, the site has been vacant undeveloped land since at least 1938. In addition, there was no observable evidence of historical irrigation or farming structures during the site reconnaissance.

4.1.4 Mines

Based on the review of historical sources (aerial photographs and historic topographic maps) and the database search report, there is no evidence to indicate that the site was ever utilized for mining operations.

4.1.5 Illegal Drug Manufacturing

The proposed site was not identified by the California Hazardous Material Incident Report System (CHMIRS) which is maintained by the California Office of Emergency Services and contains information regarding hazardous material incidents such as accidental releases or spills. Drug-related waste was not observed on the site during the site inspection

4.1.6 Prior U.S. Government Ownership

According to historical aerial photographs the subject site has been vacant undeveloped land since at least 1938. There is no indication that the property was owned by the U.S. Government or utilized for military operations.

4.2 PAST USAGE OF ADJOINING PROPERTIES

Based on review of historical aerial photographs, the properties immediately surrounding the Site to the south and west were vacant undeveloped land until development for agricultural purposes from about 1967 to about 1980. The properties to the south and west have been residential dwellings since at least 1989. A property to the north was developed with a rural dwelling from at least 1953 to about 2002. The remaining adjoining properties have been vacant, undeveloped land since at least 1901

4.2.1 Aerial Photographs

Aerial photographs were obtained from EDR for the years 1938, 1953, 1967, 1980, 1989, 1994, 2002 and 2005 and were reviewed for properties adjoining the subject site. Copies of the aerial photographs are included in Appendix A. Land immediately surrounding the Site consists of undeveloped vacant land to the north and east, and residential dwellings to the south and west. Land uses surrounding the school have included undeveloped land, residential and some agricultural use.

4.2.2 Historical Topographic Maps

Historical topographic maps were obtained from EDR for the years 1901, 1943, 1953, 1967 and 1980 were reviewed for properties adjoining the subject site. Copies of the topographic maps are included in Appendix A Land immediately surrounding the Site consists of undeveloped vacant land to the north and east, and residential dwellings to the south and west. Land uses surrounding the site have included undeveloped land, residential and some agricultural use.

STANDARD ENVIRONMENTAL RECORDS REVIEW

The Planning Center utilized the electronic database service EDR to complete the environmental records review The database search was used to identify properties that may be listed in the referenced Agency records, located within the ASTM-specified search radii indicated below:

- NPL sites: .... 1 mile
- CERCLIS sites: .... 0.5 mile
- CERCLIS NFRAP sites .... Site and Adjoining
- Federal ERNS: .... Site only
- RCRA non-CORRACTS TSD facilities: .... 0.5 mile
- RCRA CORRACTS TSD facilities: .... 1 mile
- RCRA Generators: .... Site & Adjoining
- State Hazardous Waste Sites: .... 1 mile
- Registered Underground Storage Tanks: .... Site & Adjoining
- State Landfills and Solid Waste Disposal Sites: .... 0.5 mile
- State Leaking Underground Storage Tanks: .... 0.5 mile

A review of selected regulatory agency databases for documented environmental concerns on the site, or in close proximity to the site, was conducted by EDR (a copy of the EDR Report dated February 29, 2008 is included in Appendix B).

The subject site was not identified on any of the databases searched. The following is a summary of information provided for each of the above-listed databases.

5.1.1 *NPL Sites*

The National Priorities List (NPL) is a list of contaminated sites that are considered the highest priority for clean-up by the EPA

- The subject site is not listed on the NPL List
- The database search did not identify any NPL sites within a mile radius of the subject site.

5.1.2 *CERCLIS Sites*

The Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS) list identifies sites which are suspected to have contamination and require additional investigation to assess if they should be considered for inclusion on the NPL.

- The subject site is not listed on the CERCLIS List

- The database search did not identify any CERCLIS sites within a one-half mile radius of the subject site

5.1.3 CERCLIS-NFRAP Sites

CERCLIS-NFRAP status indicates that a site was once on the CERCLIS List but has No Further Response Actions Planned (NFRAP). Sites on the CERCLIS-NFRAP List were removed from the CERCLIS List in February 1995 because, after an initial investigation was performed, no contamination was found, contamination was removed quickly, or the contamination was not significant enough to warrant NPL status.

- The subject site is not listed on the CERCLIS-NFRAP List.
- The database search did not identify any CERCLIS-NFRAP sites adjacent to the subject site.

5.1.4 Federal ERNS List

The Federal Emergency Response Notification System (ERNS) list tracks information on reported releases of oil and hazardous materials.

- The subject site is not identified on the Federal ERNS list.

5.1.5 RCRA Non-CORRACTS TSD Facilities

The Resource Conservation and Recovery Act (RCRA) non-CORRACTS TSD Facilities List tracks facilities which treat, store, or dispose of hazardous waste and are not associated with corrective action activity.

- The subject site is not listed as a RCRA non-CORRACTS TSD facility.
- The database search did not identify any RCRA non-CORRACTS TSD facilities within a one-half mile radius of the subject site.

5.1.6 RCRA CORRACTS TSD Facilities

The RCRA CORRACTS TSD Facilities list catalogues facilities that treat, store, or dispose of hazardous waste and have been associated with corrective action activity.

- The subject site is not listed as a RCRA CORRACTS TSD facility.
- The database search did not identify any RCRA CORRACTS TSD facilities within a one-mile radius of the subject site.

5.1.7 RCRA Generators

The RCRA Generator list is maintained by the EPA to track facilities that generate hazardous waste.

- The subject site is not listed as a RCRA Hazardous Waste Generator.

5.1.8 State Sites and State Spill Sites

The Cal-Sites database, maintained by the DTSC, contains both known and potential hazardous substance sites.

- The subject site is not listed as a State Site or State Spill Site.
- The database search did not identify any State Sites or State Spill Sites within a one mile radius of the subject site

5.1.9 Cortese List

The Cortese list database identifies hazardous waste sites selected for remedial action and underground storage tank (UST) properties having a reportable release and is maintained by the EPA/Office of Emergency Information.

- The subject site is not listed on the Cortese List.
- The database search did not identify any Cortese sites within a one-half mile radius of the subject site.

5.1.10 Registered Underground Storage Tanks (USTs)

The State Water Resources Control Board's Hazardous Substance Storage Container Database maintains a list of USTs regulated by the Resource Conservation and Recovery Act.

- The subject site is not listed on the registered UST list.
- The database search did not identify registered USTs within a ¼-mile of the site.

5.1.11 Facility Inventory Database USTs

The State Water Resource Control Board's Facility Inventory Database contains a historical listing of active and inactive underground storage tank locations.

- The subject site is not listed as containing active and/or inactive underground storage tank locations.
- The database search did not identify sites listed as containing active and/or inactive underground storage tank locations within a ¼-mile of the site

5.1.12 State Landfills and Solid Waste Disposal Sites

- The database search did not identify any State Landfills or Solid Waste Disposal Sites within a one-half mile radius of the subject site.

5.1.13 State Leaking Underground Storage Tanks

The State Water Resources Control Board Leaking Underground Storage Tank Information System contains an inventory of Leaking Underground Storage Tank (LUST) Incident Reports.

- The subject site is not listed on the LUST list

- The database search did not identify any LUST facilities within a half-mile radius of the subject site.

5.1.14 MINES

The Department of Labor, Mines Safety, and Health Administration maintains the Mines Master Index File. The database is updated semi-annually.

- The subject site is not listed on the Mines Master Index File.
- The database search did not identify sites on the Mines Master Index File adjacent to the subject site.

5.2 ADDITIONAL ENVIRONMENTAL RECORDS REVIEW

In conformance with ASTM inquiry was made with representatives of the agencies described below and with the user of this Phase I.

5.2.1 Proximity to High-Pressure Gas Lines or Fuel Transmission Lines

A letter was sent to the Southern California Gas Company (SCGC) on May 2, 2008 requesting information regarding the location of high-pressure pipelines located within a 1,500 foot radius of the subject site. A response was received on May 16, 2008 Based on the information received from the SCGC there [illegible] high pressure pipelines [illegible] in the vicinity of the subject site (Appendix C)

5.2.2 State of California Division of Oil and Gas Records

A review of California Division of Oil and Gas Regional Wildcat Map W1-7 (California Department of Conservation 2004) indicates that there are no active or abandoned oil or gas fields on the subject site or adjoining properties. The closest oil well is located approximately two miles east of the subject site. The well is identified as a plugged and abandoned dry hole drilled by Perri Oil Co in 1956 to a depth of 3,711 feet. The oil wells in the vicinity were dry non-producing wells that were plugged shortly after completion The oil and gas map pages showing the vicinity of the closest oil wells are included in Appendix C.

The environmental databases reviewed as part of this Phase I include the Former Manufactured Gas Sites database (Coal Gas). The subject site and surrounding sites were not identified on the Coal Gas database, thereby, providing additional information on the absence of gas fields in the immediate area of the subject site (Appendix B).

5.2.3 User-Provided Information

The ASTM Standard requires disclosure in the Phase I report whether the user of the report has specialized knowledge about previous ownership or uses of the property that may be material to identifying RECs or HRECs, or whether the user has determined that the property's Title contains environmental liens or other information related to environmental condition of the property, including engineering and institutional controls and Activity and Use Limitations, as defined by ASTM. In addition, we are required by the ASTM Standard to inquire whether the user of the report has prior knowledge that the price of the property has been reduced for environmentally-related reasons.

The Planning Center was informed by the user that to their knowledge there are no liens or other information about the environmental condition of the property in the Title. In addition, the user was not aware of specialized knowledge about previous ownership or uses of the property that may be material to identifying RECs with the exception of the information provided above, and has not indicated that the price of the property has been reduced for environmentally-related reasons.

This page intentionally left blank.

6. Site Reconnaissance and Key Personnel Interview(s)

A site visit to observe site conditions was conducted by Michael Watson of The Planning Center on May 16, 2008. Mr Watson was unaccompanied during the site visit. The Planning Center personnel observed the exterior portions of the property, including the property boundaries. No weather-related conditions or other conditions that would limit our ability to observe the site occurred during our site reconnaissance. Site photographs are included in Appendix D.

ASTM Section 9 8 requires that, prior to the site visit, the current site owner or Key Site Manager and user, if different from the current owner or Key Site Manager, be asked if there are any helpful documents or information that can be made available for review. These consist of environmental site assessment reports, audits, permits, tank registrations, Material Safety Data Sheets, Community Right-to-Know plans, safety plans, hydrogeologic or geotechnical reports, or hazardous waste generator reports. The District provided a figure, and verbal information regarding the property.

6.1 CURRENT USE OF THE PROPERTY

The Site consists of an approximately 75.1-acre parcel of vacant, undeveloped land.

6.2 SITE VISIT OBSERVATIONS

6.2.1 General Description of Structures

The subject site contains no structures

6.2.2 Heating and Cooling System

The subject site contains no structures.

6.2.3 Potable Water Supply and Sewage Disposal System or Septic Systems

Potable water and sewer services will be provided to the site by the Eastern Municipal Water District (EMWD). Approximately 75% of EMWD's potable water demand is supplied by imported water from Metropolitan Water District through its Colorado River Aqueduct and its connections to the State Water Project. Approximately 25% of EMWD's potable water demand is supplied by EMWD groundwater wells. The majority of the groundwater produced by EMWD comes from its wells in the Hemet and San Jacinto area, where it is also served. EMWD also has wells in the Moreno Valley, Perris Valley, and Murrieta areas.

6.2.4 Use of Petroleum Products and Hazardous Materials

Use of petroleum products or hazardous materials was not observed at the subject site.

6.2.5 Storage of Petroleum Products and Hazardous Materials (Storage Tanks, Drums)

No hazardous materials were observed or reported at the subject site.

6.2.6 Disposal of Petroleum Products and Hazardous Materials

No evidence of disposal of petroleum products or hazardous materials was observed at the subject site.

6.2.7 *Hydraulic Elevators*

No hydraulic elevators were observed at the subject site.

6.2.8 *Vehicle Maintenance Lifts*

No vehicle maintenance lifts were observed at the subject site.

6.2.9 *Emergency Generators and Sprinkler System Pumps*

No emergency generators or sprinkler system pumps were observed on the subject site.

6.2.10 *Polychlorinated Biphenyls (PCBs) Associated with Electrical or Hydraulic Equipment*

No electrical or hydraulic equipment was observed on the subject site. Pole-mounted transformers were observed in the right-of-way along Ironwood Avenue. Based on the information above, PCBs are not expected to have impacted the subject site.

6.2.11 *Floor Drain and Sumps*

No sumps or floor drains were observed at the subject site.

6.2.12 *Catch Basins*

No catch basins were observed at the subject site.

6.2.13 *Dry Wells*

No dry wells were observed at the subject site.

6.2.14 *Pits, Ponds, Lagoons, and Pools of Liquid*

No pits, ponds, lagoons, observed at the subject site.

6.2.15 *Odors*

No odors were observed at the subject site.

6.2.16 *Stains or Corrosion on Floors, Walls, or Ceilings*

No buildings are located on the subject site.

6.2.17 *Stained Soil or Pavement*

No stained soil or pavement was observed at the subject site.

6.2.18 *Stressed Vegetation*

No stressed vegetation was observed at the subject site

6. Site Reconnaissance and Key Personnel Interview(s)

6.2.19 Solid Waste and Evidence of Waste Filling

No evidence of waste filling was observed on the subject site.

6.2.20 Wastewater and Stormwater Discharge

No wastewater discharge was observed on the subject site The site is not paved and stormwater is expected be minimal.

6.2.21 Monitoring, Water Supply, or Irrigation Wells

No monitoring, water supply, or irrigation wells were observed at the subject site.

6.2.22 Sanitary Sewer and Septic Systems

Sanitary sewage in the vicinity is discharged by the EMWD sewage collection system No septic systems were observed on the subject site

6.2.23 Non-Scope Considerations

- No evidence of fill material was observed on the subject site. The site has not been developed
- Based on a review of aerial photographs, topographic maps, and a site inspection, the proposed school site is not located within 1,500 feet of a railroad track easement.
- According to aerial photographs and topographic maps, the site has been vacant land since at least 1901. Therefore, lead-based paint, termiticides and asbestos-containing material are not expected to have been used on the site

INTERVIEWS

Interviews were conducted with Ms. Amber Caudill on May 29, 2008. Ms. Caudill is a facilities planner for the District. Ms. Caudill participated in filling out a site questionnaire, which is included in Appendix E. Ms. Caudill is not aware of any USTs or other operations associated with the site

6. *Site Reconnaissance and Key Personnel Interview(s)*

This page intentionally left blank.

7. *Data Gap Identification*

No site or adjacent land owners were interviewed for this Phase I Environmental Site Assessment. In addition, chain-of-title documents were not obtained for the site.

7. *Data Gap Identification*

This page intentionally left blank.

8. Findings and Conclusions

The Planning Center has performed a Phase I Environmental Site Assessment on behalf of the Moreno Valley Unified School District, for the Proposed Alternate High School 5 – Ironwood/Nason located at the northeast corner of Ironwood Avenue and Nason Street in the City of Moreno Valley, Riverside County, California. The subject site consists of an undeveloped parcel of land approximately 75.1 acres in size.

The scope of work is described and conditioned by our proposal dated April 15, 2008 As indicated in our proposal, this Phase I was performed in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) E 1527-05 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. Exceptions to, or deletions from, this practice are described in Section 1 of this report Our conclusions are intended to help the user evaluate the "environmental risk" associated with the site, as defined in the ASTM E 1527-05 Standard and discussed in the Introduction section of this report.

RECOGNIZED ENVIRONMENTAL CONDITIONS

The goal of the ASTM E 1527-05 Standard practice is to identify Recognized Environmental Conditions (RECs), as defined in the Standard and in Section 1 of this report.

This assessment has revealed no evidence of RECs in connection with the subject site as defined in the Standard and in Section 1 of this report and DTSC recommended school guidance for Phase I assessments.

HISTORICAL RECS AND KNOWN OR SUSPECT ENVIRONMENTAL CONDTIONS

The ASTM E 1527-05 Standard also requires that historical RECs (HRECs) and other known or suspect environmental conditions, as defined in the Standard and in Section 1 of this report are identified in the Phase I.

This assessment has revealed no evidence of HRECs or known environmental conditions in connection with the subject site.

SUMMARY

Based on the results of this assessment, RECs, HRECs, and known environmental conditions associated with the subject site were not identified. No further assessment or investigation is recommended for the subject site.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of the ASTM Standard Practice for Assessment of Vapor Encroachment into Structures on Property Involved in Real Estate Transactions (E 2600-10).

STANDARD ENVIRONMENTAL RECORDS	Maximum Search Distance*	Summary: property	1/10	1/10 - 1/3
Federal NPL	0.333	0	0	0
Federal CERCLIS	0.333	0	0	0

AQUIFLOW®

Search Radius: 0.333 Mile.

No Aquiflow sites reported.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Terrace escarpments

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: VISTA

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

EXECUTIVE SUMMARY

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil

Soil Map ID: 3

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

EXECUTIVE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		Soil Reaction (pH)
1	0 inches	7 inches	coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 5.6
2	7 inches	40 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.8 Min: 5.6
3	40 inches	59 inches	stratified loamy sand to coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6

Soil Map ID: 4

Soil Component Name: MONSERATE

Soil Surface Texture: sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

EXECUTIVE SUMMARY

RECORD SOURCES AND CURRENCY

To maintain currency of the following databases, EDR contacts the appropriate agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

PRP: Potentially Responsible Parties

Standard Environmental Record Source: Other Standard Environmental Records
Search Distance: Property

A listing of verified Potentially Responsible Parties

Date of Government Version: 04/15/2013
Number of Days to Update: 72
Last EDR Contact :09/30/2014

Source: EPA
Telephone: 202-564-6023

RMP: Risk Management Plans

Standard Environmental Record Source: Other Standard Environmental Records
Search Distance: Property

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

DEED: Deed Restriction Listing

Standard Environmental Record Source: Other Standard Environmental Records

Search Distance: 0.333 Mile

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

ENVIROSTOR: EnviroStor Database

Standard Environmental Record Source: State and tribal - equivalent CERCLIS
Search Distance: 0.333 Mile

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

HAZNET: Facility and Manifest Data

Standard Environmental Record Source: Other Standard Environmental Records
Search Distance: Property

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

2020 COR ACTION: 2020 Corrective Action Program List
Standard Environmental Record Source: Other Standard Environmental Records
Search Distance: 0.25 Mile

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

Last EDR Contact :08/28/2014

Source: EPA
Telephone: 703-412-9810

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Standard Environmental Record Source: Other Standard Environmental Records
Search Distance: 0.333 Mile

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

EPA WATCH LIST: EPA WATCH LIST

Standard Environmental Record Source: Other Standard Environmental Records

Search Distance: Property

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

Standard Environmental Record Source: Other Standard Environmental Records
Search Distance: Property

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

EDR MGP: EDR Proprietary Manufactured Gas Plants

Standard Environmental Record Source: Former manufactured Gas Plants

Search Distance: 0.333 Mile

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

Standard Environmental Record Source: Historical Gas Stations

Search Distance: 0.25 Mile

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

RECORD SOURCES AND CURRENCY

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5' minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW® Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW® Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services. The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PRELIMINARY HYDROLOGY AND HYDRAULIC STUDY FOR TENTATIVE TRACT MAP 37001 – IRONWOOD CITY OF MORENO VALLEY, CALIFORNIA

I. INTRODUCTION

Tentative Tract Map 37001 is a proposed residential development in the City of Moreno Valley. The purpose of this study is to determine the preliminary drainage improvements required to provide flood protection to the onsite area from the flows emanating from the onsite and offsite areas. Additionally, the study will determine the preliminary drainage improvements required to convey the onsite flows to the two onsite bioretention basins. The scope of this report will include the following:

- Determine the peak 100-year and 10-year flow rates for the existing condition watershed using the Riverside County Flood Control and Water Conservation District (RCFC & WCD) Rational Method.
- Determine the 100-year and 10-year flow rates for the post-project condition onsite and offsite areas using the Riverside County Flood Control and Water Conservation District (RCFC & WCD) Rational Method.
- Determine the 2-year, 24-hour storm duration peak flow rates for the pre-project and post-project areas tributary to each basin using the Riverside County Flood Control and Water Conservation District (RCFC & WCD) Unit Hydrograph Method.
- Determine the 100-year, 1-hour peak flow rate for the onsite and offsite areas tributary to the basins using the Riverside County Flood Control and Water Conservation District (RCFC & WCD) Unit Hydrograph Method.
- Determine the existing condition flow rates tributary to the existing culverts, and perform a HEC-RAS analysis for the existing flooding condition.
- Determine the post-project condition flow rates tributary to the existing culverts and streams based upon the proposed basin mitigation, and perform HEC-RAS analyses for the post-project condition.
- Develop preliminary storm drain alignments and sizes required to flood protect the project site from offsite and onsite flows.
- Determine the required water quality volume to be treated and the required storage volume of the basins to address the hydrologic conditions of concern associated with the Water Quality Management Plan.
- Preparation of a preliminary hydrology and hydraulic report, which consists of hydrological and analytical results and exhibits.

II. PROJECT SITE AND DRAINAGE OVERVIEW

TTM 37001 is a proposed residential development consisting of 181 single family lots, open space area, streets and three bioretention basins. The project is approximately 79 acres located in the City of Moreno Valley, and is roughly bounded by Nason Street to the west, Ironwood Avenue to the South, Oliver Street to the east, and open space area to the north. The project is located within Section 34 of Township 2 South, Range 3 West.

The project site proposes to collect all onsite and offsite flows via subsurface storm drain. A portion of the northerly project boundary will enter the offsite storm drain for the peak 100-year flow rate only. Low-flow pipes will be provided to divert the flow up to the 2-year, 24-hour flow rate into the basin prior to comingling with offsite flows for water quality treatment and mitigation of the hydrologic conditions of concern. The majority of the offsite flows will be conveyed to one of the two downstream culverts located at Ironwood Avenue. Flow-by structures will be utilized within the basins that allow for a certain flow rate to bypass downstream to the existing culvert crossing Ironwood Avenue, and the remaining flow to overtop into the basins for retention. This will ensure that the project does not adversely impact downstream existing properties and streams. Analyses has been performed to demonstrate that flows will not increase, and will actually decrease in the post-project condition. Detailed basin routing analyses will be performed during final engineering.

The majority of the flows westerly offsite area will be conveyed directly to an existing culvert without passing through one of the basins. The flows in excess of the existing downstream culvert capacity will be collected within a storm drain system along Nason Street, that will allow flows to bubble out into Nason Street south of Ironwood Avenue.

The project site is tributary to three existing culverts crossing Ironwood Avenue. Per a meeting with the City of Moreno Valley, the project must mitigate the peak 100-year flow rates tributary to these three existing culverts to a maximum flow rate equal to the existing capacity of these culverts. Therefore, the basins will also serve to mitigate the 100-year storm event so that the existing culvert capacities are not exceeded.

III. HYDROLOGY ANALYSIS

The RCFC & WCD Hydrology Manual (Reference 1) was used to develop the hydrological parameters for the rational method and unit hydrograph method. The calculations were performed using the computer program developed by Civil Cadd/Civil Design.

The existing soil classification for the area consists of Soil “A”, Soil “C” and Soil “D”, as shown on Exhibit G. Exhibit G is a hydrologic soils map that was obtained from the United States Department of Agriculture, Natural Resources Conservation Service (NRCS). As recommended by the County of Riverside, an Antecedent Moisture Condition (AMC) I was utilized for the 2-year storm events, and an AMC II was utilized for the 10-year and 100-year storm events.

The following rainfall depths were obtained from the RCFC & WCD Hydrology Manual’s Isohyetal Maps. The slope of intensity duration of 0.5.

Storm Event	1-hour (in)	24-hour (in)
2-Year	0.50	2.00
100-Year	1.20	5.00

The slope value used for the rational method value is 0.50. The rainfall maps have been included as Exhibit H, and the slope of intensity duration curves have been included as Exhibit I.

Pre-Project Hydrology

The offsite areas were analyzed for the existing land use as undeveloped, poor cover, as recommended by the Riverside County Hydrology Manual. The existing watershed areas were designated as Areas A, B, C, and D, as shown on Exhibit A. Area “A” is tributary to the existing 42” culvert westerly along Ironwood Avenue (Culvert A1), Area “B” is tributary to the existing 42” culvert midway between Nason Street and Oliver Street along Ironwood Avenue (Culvert B1), and Area C is tributary to the easterly 24” culvert along Ironwood Avenue (Culvert C1, see Figure 2 for existing culvert locations). Downstream of Ironwood Avenue, Areas A, B, and C confluence within the natural channel. Area D consists of the most easterly area within the watershed boundary, and is tributary to an existing culvert east of Oliver Street.

The pre-project condition rational method analyses has been included in Appendix A, and the pre-project condition rational method hydrology map has been included as Exhibit A.

Post-Project Hydrology

The post-project condition onsite and offsite rational method hydrology analyses was performed for five watershed areas designated as Areas A, B, C, D and E. Area A is the area tributary to Basin A1 and A2, Area B is tributary to Basin B, Areas C and D are tributary to the west side of Oliver Street, and Area E is tributary to the intersection of Nason Street and Ironwood Avenue. The rational method analysis for Area A was broken down into two separate hydrology models due to the number of confluences required for the models. Area A1 represents Area A up to node 136 (Basin A1), and Area A1 represents the remainder of Area A, with a user defined area utilized for Node 136 to 171. The rational method hydrology calculations for the post-project condition have been included in Appendix B, and the post-project condition hydrology map has been included as Exhibit B.

The unit hydrograph calculations analyzed five different areas (as shown on Exhibit C and Exhibit D):

- Offsite Area “A” – Offsite Area A (30.79 acres) is the area tributary to the flow-by structure located within Basin A1, and discharges into Culvert B1. Offsite Area A was analyzed for the 100-year storm events only.
- Offsite Area “B” – Offsite Area B (73.03 acres) is tributary to the flow-by structure located in Basin A2, and discharges into Culvert B1. Offsite Area B was analyzed for the 100-year storm events only.
- Onsite Area “A1” – Onsite Area A1 (17.86 acres for the 100-year storm event and 25.15 acres for the Water Quality Area and 2-year, 24-hour storm event) is tributary to Basin A1. The areas differ between the 100-year and 2-year storm events due to the low-flow storm drain systems incorporated at Node 118 and node 121. These systems will be designed to by-pass the low-flows up to the 2-year, 24-hour storm duration so that the flows will not enter the offsite storm drain system, and rather be collected by the onsite systems that discharge the entire flow rate directly

into Basin A. This will ensure that the entire onsite area is treated for water quality purposes and mitigated for the hydrologic conditions of concern.

- Onsite Area "A2" - Onsite Area A2 (23.24 acres for the 100-year storm event and 29.70 acres for the Water Quality Area and 2-year, 24-hour storm event) is tributary to Basin A2. The areas differ between the 100-year and 2-year storm events due to the low-flow storm drain systems incorporated at Node 145 and node 148. These systems will be designed to by-pass the low-flows up to the 2-year, 24-hour storm duration so that the flows will not enter the offsite storm drain system, and rather be collected by the onsite systems that discharge the entire flow rate directly into Basin A2. This will ensure that the entire onsite area is treated for water quality purposes and mitigated for the hydrologic conditions of concern.
- Onsite Area "B" – Onsite Area B is the area tributary to Basin B (15.65 acres), and includes the total rational method Area B watershed. This area was used for the water quality analysis for Basin B and for the 2-year, 24-hour unit hydrograph analysis for Basin B. The area for the water quality, 2-year, 24-hour unit hydrograph and the 100-year unit hydrograph are the same.

The unit hydrograph hydrology maps for the 100-year storm events and the 2-year, 24-hour storm duration have been included as Exhibits C and D, respectively. The 100-year unit hydrograph calculations have been included in Appendix D, and the pre-project and post-project 2-year, 24-hour unit hydrograph calculations have been included in Appendix C.

IV. HEC-RAS ANALYSES

HEC-RAS analyses were performed for the existing condition flow rates discussed in Section V and the post-project condition flow rates discussed in Section VI to determine the flooding limits for both conditions. Two streams were identified in the HEC-RAS analysis, and have been designated as the Main Channel and the Westerly Channel. The Main Channel collects flows from Culverts B1 and C1, and the Westerly Channel collects flows from A1. The cross sections for the HEC-RAS analyses were developed using 1' topographic mapping, and the following parameters were utilized in the HEC-RAS analysis:

- Manning's "n" value of 0.030 to represent open brush cover
- Mixed flow regime
- Upstream boundary conditions equal to normal depth, and a downstream boundary condition equal to a known water surface elevation which was determined by performing a Water Surface Profile Gradient Program calculation for the existing double 60" RCP culvert crossing Lantz Lane. The resulting upstream water surface elevation using the existing condition and post-project condition tributary flow rates was utilized for the starting water surface elevation for the main channel.
- Expansion and Contraction coefficients of 0.3 and 0.1, respectively.
- Roadway deck and culvert elevations determined by survey shots

Existing Condition Results

The existing condition HEC-RAS modeled the streams to four sections upstream of Ironwood Avenue to a point where flows enter a culvert at Darlene Drive. The flows were then modeled through the culverts traversing Ironwood Avenue. Based upon the HEC-RAS results, the flows will overtop the roadway at Culvert B1 (with 111.1 ft^3/s overtopping the roadway and the remaining 131.3 ft^3/s passing through Culvert B1). The flows will also overtop the roadway at the culvert crossing Walfred Way (with 149.5 ft^3/s overtopping the roadway and the remaining 167.9 ft^3/s passing through the culvert). Therefore the capacity for Culvert B1 is 131.3 ft^3/s, and will be utilized as the maximum allowable flow rate that can be discharged from the project site into Culvert B1.

The culvert crossing Lantz Lane does not have capacity to convey the tributary flow of 87.2 ft^3/s. Based upon iterations with the HEC-RAS analyses, a total of 46.0 ft^3/s can be conveyed through the culvert, and 41.2 ft^3/s overtops Lantz Lane and is conveyed southerly within Lantz Lane.

The existing condition HEC-RAS flood plain has been delineated on Exhibit K, and the existing condition HEC-RAS calculations has been included in Appendix H.

Post-Project Condition Results

The post-project condition HEC-RAS modeled the streams from Ironwood Avenue to a point where flows enter a culvert at Darlene Drive. The starting flow rates for the post-project condition are equal to the flows discharging from Culverts A1 and B1. A detailed discussion for the post-project flow rates used in the HEC-RAS analyses has been provided in Section VI.

Based upon the HEC-RAS results, the flows at Walfred Lane will overtop the roadway, with 1.1 ft^3/s overtopping the roadway and the remaining 150.5 ft^3/s passing through the culvert.

The HEC-RAS results indicate that flows will break out at the culvert crossing Lantz Lane, as also determined in the existing condition HEC-RAS. The flow rate was decreased from 87.2 ft^3/s until the flows no longer overtopped the roadway. The flow rate that will be conveyed through the culvert and not overtop the roadway is 46.0 ft^3/s, and the remaining 41.2 ft^3/s will be conveyed southerly down Lantz Lane.

The HEC-RAS calculations have been included in Appendix H and the flood plain delineation has been shown on Exhibit L.

V. EXISTING FLOODING ANALYSIS

An existing condition rational method hydrology was performed for the area tributary to the natural streams upstream and downstream of Ironwood Avenue. Currently, there are three culverts crossing Ironwood Avenue, designated as Culvert A1 (the westerly 42" CMP Culvert), Culvert B1 (the easterly 42" CMP Culver) and Culvert C1 (the easterly 24" CMP Culvert). An exhibit has been prepared (see Exhibit J) which summarizes the flow rate analyses, and the following paragraphs provide detailed descriptions of the analyses.

Point 1 is located at the intersection of Ironwood Avenue and Nason Street. The existing condition flow rate is 89.7 ft^3/s per the existing condition rational method calculations at node 104 to 108 (see Exhibit A for Existing Condition Hydrology Map). Capacity calculations were performed for the north and south sides of Ironwood Avenue to determine the amount of flow that would be conveyed to the east within Ironwood Avenue. The north side of Ironwood Avenue would discharge into the natural stream tributary to Culvert A1, and has a capacity of 33.6 ft^3/s. The south side of Ironwood Avenue would discharge at the low-point on the south side of Culvert B1, and has a capacity of 21.6 ft^3/s. The remaining 34.5 ft^3/s, which overtops the Ironwood Avenue Centerline, would be conveyed in a southerly direction along Nason Street.

Point 2 is the upstream end of Culvert A1, and has a flow rate of 75.8 ft^3/s. This flow rate was determined by taking the existing condition flow rate from the rational method calculations at nodes 107 to 108 of 42.2 ft^3/s, and adding the 33.6 ft^3/s from the north side of Ironwood Avenue. This flow rate would be conveyed to the south side of Ironwood, as the capacity of Culvert A1 based upon the nomographs is 78.0 ft^3/s.

Point 3 is located downstream of Culvert A1, and has a flow rate equal to the existing condition flow rate at nodes 109-215 of 142.1 ft^3/s, minus the 21.6 ft^3/s conveyed easterly in the southerly half of Ironwood Avenue to the low-point on Ironwood Avenue and minus the 33.4 ft^3/s splitting to the south along Nason Street, for a total flow rate within this channel of 87.2 ft^3/s.

Point 4 is located downstream of the culvert crossing Lantz Lane. Based upon iterations with the HEC-RAS model, a total of 46.0 ft^3/s can be conveyed through the culvert, and the remaining 41.2 ft^3/s will overtop and split to the south along Lantz Lane.

Point 5 is the upstream point of Cuvert B1 which has a tributary flow rate of 241.6 ft^3/s per the existing condition rational method calculations at Node 212. However, Culvert B1 has a capacity of 131.3 ft^3/s per the HEC-RAS calculations, therefore the remaining flows will overtop the roadway. Since Ironwood Avenue is a low point at the Culvert B1 crossing, all flows overtopping Ironwood Avenue will enter the stream downstream of Culvert B1. Point 6 is the upstream point of Culvert C1, which has an existing condition flow rate of 39.2 ft^3/s at node 303. The capacity of Culvert C1 based upon the nomograph is 40.0 ft^3/s, therefore all 39.2 ft^3/s will be conveyed through the culvert. Both Culverts B1 and C1 are tributary to Point 7.

The flow rate at Point 7, which is the location upstream of the culvert crossing Walfred Way, was determined by taking the flow rate from the existing condition rational method calculations at node 214 of 295.8 ft^3/s (which is the confluence point for Culvert B1 and C1 flows), and adding the flows from the south side of Ironwood Avenue of 21.6 ft^3/s, resulting in a total tributary flow rate of 317.4 ft^3/s. This flow rate is conveyed to Point 8, which is downstream of the culvert crossing Walfred Way. Based upon the HEC-RAS analyses, the flows at this culvert will overtop the roadway, however, the roadway incorporates a low point at this location, and therefore all flows will continue to the south side of the culvert crossing.

Point 9 is the location where Point 4 and Point 8 flows confluence. The flow rate at this location was determined by taking the existing condition flow rate at node 216 of 489.0 ft^3/s, and subtracting the 33.4 ft^3/s that splits southerly along Nason Avenue and the 41.2 ft^3/s that splits southerly along Lantz Lane, resulting in a total flow rate of 414.5 ft^3/s at Point 9.

These flow rates were utilized in the HEC-RAS analyses for the existing condition, which is discussed in the HEC-RAS section. The normal depth calculations for the street capacities of Ironwood Avenue have been included in Appendix I.

VI. POST-PROJECT CONDITION FLOW RATE AND MITIGATION ANALYSES

Since the post-project condition will implement basins and flow-by structures to mitigate runoff, unit hydrograph calculations were required in order to appropriately size the basins. The rational method calculations are utilized for the sizing of storm drain and for the HEC-RAS flood plain analyses.

Based upon the HEC-RAS analyses for the existing condition, the post-project condition sends 75.8 ft^3/s through Culvert A1, which is the existing condition flow rate for Culvert A1 and Culvert B1 can convey a total of 131.3 ft^3/s. These flow rates are based upon the rational method hydrology analyses. In order to determine the rational method flow rate for each storm drain discharging from the splitter structure, the ratio of the two peak flow rates to each basin was determined. The 67.5 ft^3/s tributary to the splitter structure within Basin A1 is 31.4% of the total flow rate tributary to Culvert B1 (67.5 ft^3/s ÷ 215.3 ft^3/s). The Basin A2 splitter structure has 68.6% of the total tributary flow rate. Therefore, each basin will contribute this percentage of the allowable flow rate. Basin A1 will discharge 31.4% of the allowable flow rate tributary to Culvert B1 and Basin A2 will discharge 68.6% of the allowable flow rate tributary to Culvert B1, resulting in 41.2 ft^3/s for Basin A1 and 90.1 ft^3/s for Basin A2.

Offsite Area E has a total flow rate at node 505 of 91.5 ft^3/s in the post-project condition. Since Culvert A1 has an existing condition flow rate of 75.8 ft^3/s, a structure will be designed at Node 505 such that 75.8 ft^3/s will enter the storm drain system and the remaining 15.7 ft^3/s will overtop to inlets provided at the intersection of Nason Street and Ironwood Avenue.

Culvert B1 (Basins A2 an A1) has a total 100-year rational method tributary flow rate of 67.5 ft^3/s from Offsite Area A at node 122 and 147.8 ft^3/s from Offsite Area B at node 149, for a total tributary flow rate of 215.3 ft^3/s, which is greater than the 131.3 ft^3/s allowable for Culvert B1. Therefore, two flow-by structures will be required within Basins A1 and A2 to allow a limited amount of flow to bypass, and the remaining flow and volume to overtop into the basins. To determine the volume required to be stored in order to mitigate the flows, unit hydrograph calculations were required. In order to more appropriately compare the unit hydrograph flow rates and the rational method flow rates for the area, the ratio of the allowable rational method flow rate out (131.3 ft^3/s) compared to the inflow rational method flow rate (215.3 ft^3/s) was determined, and is equal to 61.0%. This percentage was multiplied by the peak unit hydrograph flow rates for the 100-year, 1-hour storm duration to determine the equivalent allowable flow rate to by-pass for the unit hydrograph calculations. The 100-year, 1-hour unit hydrograph for offsite area A resulted in a peak flow rate of 74.7 ft^3/s and offsite area B resulted in a peak flow rate of 159.9 ft^3/s. Taking 61.0% of these flows results in 45.6 ft^3/s allowable to discharge from Basin A1, and 97.5 ft^3/s to discharge from Basin A2. When comparing these allowable flow rates to the different durations for the 100-year storm event, the 1-hour storm duration for Basin A1 and the 1-hour and 3-hour durations for Basin A2 will require storage within Basins.

In order to determine the volume required to be stored for the applicable durations, corresponding flow rates were found within the unit hydrograph calculations on the rising and recess limbs of the hydrograph. The corresponding volumes for these flow rates were subtracted to obtain the volume that must overtop the splitter structure and be stored within the basin. The following tables summarizes the results:

Basin A1 – Area A1 Offsite Unit Hydrograph

100-Year, 1-hour Flow Rate	Maximum Allowable Flow Rate	Corresponding Flow Rates on limbs of hydrograph	Corresponding Volumes	Volume Required to Be Retained
74.7 ft^3/s	45.6 ft^3/s	31.08 ft^3/s	1.0008 ac-ft	1.3661 ac-ft
		27.49 ft^3/s	2.3669 ac-ft	

Basin A2 – Area A2 Offsite Unit Hydrograph

100-Year, 1-hour Flow Rate	Maximum Allowable Flow Rate	Corresponding Flow Rates on limbs of hydrograph	Corresponding Volumes	Volume Required to Be Retained
159.9 ft^3/s	97.5 ft^3/s	66.16 ft^3/s	2.0783 ac-ft	3.1096 ac-ft
		69.92 ft^3/s	5.1879 ac-ft	

100-Year, 3-hour Flow Rate	Maximum Allowable Flow Rate	Corresponding Flow Rates on limbs of hydrograph	Corresponding Volumes	Volume Required to Be Retained
98.6 ft^3/s	97.5 ft^3/s	89.63 ft^3/s	5.3343 ac-ft	1.2671 ac-ft
		85.37 ft^3/s	6.6014 ac-ft	

These additional volumes will be stored within the basin. A discussion and summary table of the basin volumes and outflows has been provided in the following paragraphs.

Basin A1 (Unit Hydrograph Summary)

	100-Year Storm Events			
	1-Hour	**3-Hour**	**6-Hour**	**24-Hour**
Onsite Flow Rate	41.6 ft^3/s	25.5 ft^3/s	21.8 ft^3/s	8.1 ft^3/s
Offsite Flow Rate	74.7 ft^3/s	44.0 ft^3/s	34.4 ft^3/s	16.2 ft^3/s
Allowable Offsite Flow-By	45.6 ft^3/s	45.6 ft^3/s	45.6 ft^3/s	45.6 ft^3/s
Onsite Volume Generated	1.3901 ac-ft	1.8294 ac-ft	2.2213 ac-ft	3.9417 ac-ft
Offsite Volume Generated	2.6284 ac-ft	3.5390 ac-ft	3.828 ac-ft	6.3263 ac-ft
Basin Storage Volume	3.0960 ac-ft	3.0960 ac-ft	3.0960 ac-ft	3.0960 ac-ft
Onsite Volume Retained [1]	1.3901 ac-ft	1.8294 ac-ft	2.2213 ac-ft	3.0960 ac-ft
Offsite Volume Retained [2]	1.3661 ac-ft	0 ac-ft	0 ac-ft	0 ac-ft
Total Volume Retained	2.7892 ac-ft	1.8294 ac-ft	2.2213 ac-ft	3.0960 ac-ft
Maximum Basin Outflow [3]	45.6 ft^3/s	44.0 ft^3/s	34.4 ft^3/s	21.7 ft^3/s

1 – The onsite volume retained equals the total onsite volume generated, with the exception of the 24-hour storm duration. This duration resulted in a larger volume than available to store within the basin, therefore a corresponding flow rate was calculated on the recess limb of the hydrograph where the calculations reached 3.0960 ac-ft of volume generated, equaling 5.53 ft^3/s of outflow.

2 – The offsite Volume retained for the basin was determined in the previous summary tables by taking the delta volume difference between the rising a recess limbs of the hydrograph where approximately 45.6 ft^3/s occurs. The 3-hour, 6-hour and 24-hour durations have peak flows less than the 45.6 ft^3/s allowable, therefore the entire flow rates for these durations will flow-by.
3 – The maximum basin outflow equals the maximum flow-by for the 1-hour storm duration, the peak flow rate for the offsite 3-hour and 6-hour storm duration, and the peak offsite flow rate plus the Basin A1 onsite outflow of 5.5 ft^3/s, which is discussed in detail in the following paragraphs.

Since the onsite 24-hour storm duration volume generates more volume than the proposed basin can store, the corresponding flow rate that would discharge from the basin had to be determined. The basin storage volume is 3.096 ac-ft. The Onsite Area A1 unit hydrograph calculations for the 100-year, 24-hour storm duration have a flow rate of 5.5 ft^3/s at a volume of 3.0646 ac-ft, which is the closest volume to the basin volume without going over. Therefore this is the maximum flow rate that will discharge from the basin for the 100-year, 24-hour storm duration from the onsite area is 5.5 ft^3/s. Adding this to the flow-by for the 100-year, 24-hour storm duration for the offsite area of 16.2 ft^3/s results in a total outflow for the 24-hour storm duration of 21.7 ft^3/s.

Basin A2 and Basin B (Unit Hydrograph Summary)

	100-Year Storm Events			
	1-Hour	**3-Hour**	**6-Hour**	**24-Hour**
Onsite Flow Rate [4]	96.7 ft^3/s	56.5 ft^3/s	48.4 ft^3/s	17.7 ft^3/s
Offsite Flow Rate	159.9 ft^3/s	98.6 ft^3/s	82.6 ft^3/s	36.0 ft^3/s
Allowable Offsite Flow-By	97.5 ft^3/s	97.5 ft^3/s	97.5 ft^3/s	97.5 ft^3/s
Onsite Volume Generated [4]	3.0274 ac-ft	3.9614 ac-ft	4.7718 ac-ft	8.4048 ac-ft
Offsite Volume Generated	6.0253 ac-ft	7.7868 ac-ft	8.0310 ac-ft	12.9052 ac-ft
Basin Storage Volume	7.9900 ac-ft	7.9900 ac-ft	7.9900 ac-ft`	7.9900 ac-ft
Onsite Volume Retained [1]	3.0274 ac-ft	3.9614 ac-ft	4.7718 ac-ft	7.9900 ac-ft
Offsite Volume Retained [2]	3.1096 ac-ft	1.2671 ac-ft	0 ac-ft	0 ac-ft
Total Volume Retained	6.1370 ac-ft	5.2285 ac-ft	4.7718 ac-ft	7.9900 ac-ft
Maximum Basin Outflow [3]	97.5 ft^3/s	97.5 ft^3/s	82.6 ft^3/s	38.9 ft^3/s

1 – The onsite volume retained equals the total onsite volume generated, with the exception of the 24-hour storm duration. This duration resulted in a larger volume than available to store within the basin, therefore a corresponding flow rate was

calculated on the recess limb of the hydrograph where the calculations reached 7.9900 ac-ft of volume generated, equaling 2.9 ft^3/s of outflow. A detailed discussion on this is provided in the following paragraphs.
2 – The offsite volume retained for the basin was determined in the previous summary tables by taking the delta volume difference between the rising and recess limbs of the hydrograph where approximately 97.5 ft^3/s occurs. The 6-hour and 24-hour durations have peak flows less than the 97.5 ft^3/s allowable, therefore the entire flow rates for these durations will flow-by.
3 – The maximum basin outflow equals the maximum flow-by for the 1-hour and 3-hour storm durations, the peak flow rate for the 6-hour storm duration, and the peak offsite flow rate plus the Basin A2 and Basin B onsite outflow of 2.9 ft^3/s, which is discussed in detail in the following paragraphs.
4 – The onsite flow rate and volume is equal to the summation of Onsite Area A1 and Onsite Area B flow rates and volumes.

Since the onsite 24-hour storm duration volume generates more volume than the proposed basin can store, the corresponding flow rate that would discharge from the basin had to be determined. The basin storage volume is 7.9900 ac-ft, and the summation of the volumes generated from both onsite Area A2 and B is 8.4048 ac-ft, resulting in a net excess volume of 0.4148 ft^3/s. Since this basin has two tributary unit hydrographs that will equalize, this value was divided by two (equaling 0.2074 ac-ft) and subtracted from each onsite 100-year, 24-hour storm duration unit hydrograph total generated volume, which was 4.8091 ac-ft for Basin A2 and 3.1809 ac-ft for Basin B. The corresponding flow rates at these volumes for each hydrograph was utilized as the peak flow rate for the onsite areas that would leave the basins, 0.8 ft^3/s and 2.1 ft^3/s, respectively, totaling 2.9 ft^3/s that will discharge into Culvert B1 from the onsite areas. Adding this to the 100-year, 24-hour peak flow rate for the offsite area results in a total flow rate of 38.9 ft^3/s discharging into Culvert B1 for the 100-year, 24-hour storm duration.

At Point 1, the post-project condition flow rate is 91.5 ft^3/s per the post-project rational method hydrology calculations at node 509 (see Exhibit B). A pipe and inlet will be designed to intercept 75.8 ft^3/s of this flow rate, and discharge into Culvert A1. This will ensure that flows discharging from Culvert A1 will not exceed the pre-project flow rates in the post-project condition. The remaining 15.7 ft^3/s will be intercepted on the north side and south sides of Ironwood Avenue on Nason Street, in addition to 1.6 ft^3/s that is generated from Area E5. A special system will be constructed so that the flows intercepted by these catch basins will be allowed to bubble out of a parkway drain within Nason Street south of Ironwood Avenue.

There will be no flows at Point 2 entering the culvert system, since the maximum allowable flow for Culvert A1 will be collected at Nason Street and Ironwood Avenue via the proposed storm drain connecting to Culvert A1. Points 3 and 4 will have the same flow rates in the post-project condition since the same flow rate will be discharging from Culvert A1.

Point 5 will collect the offsite flows from Area A and B. Area A has a 100-year, 1-hour flow rate of 41.2 ft^3/s leaving the splitter structure within Basin A1, and Area B has a 100-year, 1-hour flow rate of 90.1 ft^3/s leaving the splitter structure within Basin A2, which is a total of 131.3 ft^3/s. It should be noted that the storm drain system collecting the flows from Offsite Area A also collects a portion of the onsite areas 100-year flow rate. The storm drain will convey the flows to a structure at Basin A1 in which 41.2 ft^3/s will bypass to Culvert B1, and the remaining 100-year flows will overtop into Basin A1. It should be noted that during the preliminary stages, no flows will be sent to Culvert C1. Should this culvert be required during final engineering, no more than 39.2 ft^3/s will be tributary to this culvert, which is the existing condition tributary flow rate.

By sending a total flow rate of 75.8 ft^3/s to Culvert A1, 131.3 ft^3/s to Culvert B1, and nothing to Culvert C1, the flows leaving TTM 37001 will be less than the pre-project condition and therefore improve the existing flooding downstream of Ironwood Avenue.

Based upon the analyses, Point 7 will have a post-project flow rate of 151.6 ft^3/s, which was determined by taking the 131.3 ft^3/s discharging form Culvert B1, and adding 20.3 ft^3/s generate by the existing Area B12 (node 214 to 215). This flow rate is conveyed to Point 8.

Point 9 has a post-project flow rate of 256.5 ft^3/s, which is the sum of the 151.6 ft^3/s from Point 7, the 46.0 ft^3/s from Point 4, and the existing condition flow rate for Area B13 (node 215 to 216) of 58.9 ft^3/s.

These flow rates were utilized in the Post-Project Condition HEC-RAS analyses discussed previously. Summary tables for the increased runoff mitigation analyses have been provided in Appendix G.

VII. HYDRAULIC ANALYSIS

The proposed project consists of subsurface storm drain systems and bioretention basins. The facilities will be utilized to flood protect the project site, treat onsite flows for water quality purposes, and mitigate flows for increased runoff/address the hydrologic conditions of concern. During the preliminary stages, the storm drain systems were sized using normal depth.

The sizing of the preliminary storm drain systems utilized a minimum 1% slope, since this is the minimum slope of the in-tract streets. The offsite storm drain system Line A1 utilized a minimum slope of 1.5% due to the steepness of the terrain. The offsite systems utilized the adjacent roadway slope where applicable, and a 1%-2% slope in other locations. During final engineering, detailed water surface profile gradient program calculations shall be performed. The normal depth calculations have been included in Appendix F, and the Drainage Facilities Map has been included as Exhibit E.

In order to collect offsite flows tributary to the westerly project boundary, a trapezoidal channel will be constructed adjacent to Nason Street north of Ironwood Avenue. This channel will collect the offsite flows, and discharge 75.8 ft^3/s into Line A1. The remaining flows will be collected within one of two inlets provided at the intersection of Nason Street and Ironwood Avenue. The flows will be conveyed across Ironwood Avenue, and will bubble out of a proposed catch basin and 12" low-flow drain connected to a parkway drain. This modified design was provided at the request of the City of Moreno Valley to alleviate flooding at the intersection of Ironwood Avenue and Nason Street. Details for this design will be provided during final engineering.

Due to the requirement to provide a minimum 12 foot dry travel lane within the private streets for the 100-year storm event per the City of Moreno Valley Design Policy, Standard Plan MVSI-160A-0, catch basins were required in excess of those provided to meet the typical street flooding design criteria of:

- 10-year storm flows contained within the top-of-curb elevation
- 100-year storm flows contained within the right-of-way elevation

Since the hydrology calculations were based upon the 100-year storm event being contained within the top of curb elevation (which is the right-of-way), additional yield calculations and street capacity calculations were performed to determine the limits of storm drain in order to provide the 12 foot dry lane onsite. A map has been provided as Exhibit E which delineates the areas and summaries the yield calculations. A spreadsheet has also been provided in Appendix J which summaries the yield calculations.

VIII. WATER QUALITY AND HYDROLOGIC CONDITIONS OF CONCERN

The project site will utilize 3 bioretention basins to treat for water quality purposes and to address the hydrologic conditions of concern and increased runoff mitigation.

The required water quality volume was determined by using the Santa Ana Watershed BMP Design Volume Spreadsheets. The effective impervious fraction utilized the impervious area determined by the rational method calculations for the onsite area, and multiplied the impervious fraction by 1.0 and the pervious fraction by 0.1 (which corresponds to landscaped area per the LID manual). The results are 0.55 effective impervious fraction for Area A1, 0.55 effective impervious fraction for Area A2, and 0.486 for Area B. Area B resulted in a slightly lower value due to the tributary open space area from the north easterly project boundary.

The water quality volume, per the LID Manual, must be stored within a depth equal to or less than 6" above the surface of the soil media (which includes the voids within the soil media and gravel layer). The table below provides the required water quality volume and the volume provided within 6" of depth above the soil media:

Area	Water Quality Volume	Volume Provided with 6" Above Soil Media
A1	23,805 ft^3/s	45,932 ft^3/s
A2	28,112 ft^3/s	35,159 ft^3/s
B	13,140 ft^3/s	50,949 ft^3/s

Areas A1 and A2 are greater than the maximum allowable tributary area of 25 acres, however, per meetings with the City of Moreno Valley, this additional area (0.15 acres for Area A1 and 4.7 acres for Area A2) is acceptable.

Pre-Project and Post-Project Unit hydrograph calculations were performed for the 2-year, 24-hour storm duration to determine the required storage volume to address the hydrologic conditions of concern. During the preliminary stages, the required volume to address the Hydrologic Conditions of Concern was determined by taking the entire 2-year, 24-hour volume and retaining the volume within the basins. During final engineering, the mitigation will be validated using basin routing calculations. The following tables summarize the unit hydrograph results:

Area	Pre-Project 2-Year, 24-Hour Volume	Post-Project 2-Year, 24-Hour Volume	Basin Volume Provided
A1	0.4191 ac-ft	2.0957 ac-ft	3.0960 ac-ft
A2	0.4950 ac-ft	2.4749 ac-ft	7.9900 ac-ft [1]
B	0.2608 ac-ft	1.1560 ac-ft	7.9900 ac-ft [1]

1 – Area A2 and B will be mitigated within Basins A2 and B, which will function together for addressing the hydrologic conditions of concern and increased runoff mitigation. The total 2-year, 24-hour volume to both basins from Areas A2 and B is 3.6309 ac-ft, and the basin has a total available volume of 7.9900 ac-ft, therefore the basins have sufficient volume to address the hydrologic conditions of concern.

The water quality calculations and the hydrologic conditions of concern mitigation have been included in Appendix G.

IX. CONCLUSIONS

Drainage analyses were prepared for the project site in order to determine the pre-project and post-project conditions, the required storm drain infrastructure to flood protect the project site, and the required mitigation measures for the project site. The following conclusions were derived from the hydrology and hydraulic results:

1. The proposed storm drain alignments will provide flood protection to the project site for the 100-year storm events as well as provide a minimum 12 foot dry lane within the local streets during the 100-year storm event.
2. The proposed bioretention basins will adequately treat for water quality purposes and mitigate the 2-year, 24-hour storm duration post-project condition to pre-project levels.
3. The project will discharge flows equal to the existing culvert capacities or existing tributary flow rates, whichever is less, for the 100-year storm event. During final engineering, detailed basin routing calculations will be performed to validate the basin and flow-by structure designs.
4. The project site will not adversely impact downstream properties by mitigating increased flows to less than or equal to pre-project levels.

Program License Serial Number 6269

------------------------------------------------------------------------
Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) =  100.00 Antecedent Moisture Condition = 2

2 year, 1 hour precipitation =  0.500(In.)
100 year, 1 hour precipitation =  1.200(In.)

Storm event year = 100.0
Calculated rainfall intensity data:
1 hour intensity =  1.200(In/Hr)
Slope of intensity duration curve = 0.5000

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station      401.000 to Point/Station      402.000
**** INITIAL AREA EVALUATION ****
______________________________________________________________________
Initial area flow distance =   705.000(Ft.)
Top (of initial area) elevation =  1960.000(Ft.)
Bottom (of initial area) elevation =  1856.000(Ft.)
Difference in elevation =   104.000(Ft.)
Slope =    0.14752  s(percent)=      14.75
TC = k(0.501)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration =   10.132 min.
Rainfall intensity =      2.920(In/Hr) for a   100.0 year storm
USER INPUT of soil data for subarea
Runoff Coefficient = 0.845
Decimal fraction soil group A = 0.020
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.000
Decimal fraction soil group D = 0.980
RI index for soil(AMC 2)  =  87.50
Pervious area fraction =  1.000; Impervious fraction =  0.000
Initial subarea runoff =      3.849(CFS)
Total initial stream area =        1.560(Ac.)
Pervious area fraction = 1.000

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
Process from Point/Station      402.000 to Point/Station      403.000
**** NATURAL CHANNEL TIME + SUBAREA FLOW ADDITION ****
______________________________________________________________________
Top of natural channel elevation =   1856.000(Ft.)
End of natural channel elevation =   1840.000(Ft.)
Length of natural channel  =   335.000(Ft.)
```

```
Estimated mean flow rate at midpoint of channel =     11.608(CFS)

Natural valley channel type used
L.A. County flood control district formula for channel velocity:
 Velocity(ft/s) = (7 + 8(q(English Units)^.352)(slope^0.5)
Velocity using mean channel flow =   5.67(Ft/s)

Correction to map slope used on extremely rugged channels with
drops and waterfalls (Plate D-6.2)
       Normal channel slope =  0.0478
Corrected/adjusted channel slope =  0.0478
Travel time =    0.98 min.     TC =   11.12  min.

 Adding area flow to channel
USER INPUT of soil data for subarea
Runoff Coefficient = 0.806
Decimal fraction soil group A = 0.260
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.210
Decimal fraction soil group D = 0.530
RI index for soil(AMC 2)  =  80.34
Pervious area fraction =  1.000; Impervious fraction =  0.000
Rainfall intensity =      2.788(In/Hr) for a   100.0 year storm
Subarea runoff =     14.129(CFS) for      6.290(Ac.)
Total runoff =     17.978(CFS)       Total area =       7.850(Ac.)
End of computations, total study area =            7.85 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.

Area averaged pervious area fraction(Ap) = 1.000
Area averaged RI index number =  81.8

Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                 (In/Hr)

1       19.931     11.42                 2.089
2        2.677     14.04                 1.884
Largest stream flow has longer or shorter time of concentration
Qp =     19.931 + sum of
          Qa           Tb/Ta
           2.677 *    0.813 =      2.177
Qp =     22.108

Total of 2 streams to confluence:
Flow rates before confluence point:
      19.931       2.677
Area of streams before confluence:
       11.950        1.650
Results of confluence:
Total flow rate =     22.108(CFS)
Time of concentration =    11.420 min.
Effective stream area after confluence =     13.600(Ac.)

Process from Point/Station      508.000 to Point/Station      509.000
**** PIPEFLOW TRAVEL TIME (Program estimated size) ****
______________________________________________________________________
Upstream point/station elevation =  1856.000(Ft.)
Downstream point/station elevation =  1836.000(Ft.)
Pipe length  =   828.00(Ft.)   Manning's N = 0.013
No. of pipes = 1  Required pipe flow  =    57.310(CFS)
Nearest computed pipe diameter  =     30.00(In.)
Calculated individual pipe flow  =    57.310(CFS)
Normal flow depth in pipe =   22.22(In.)
Flow top width inside pipe =   26.30(In.)
Critical Depth =   28.48(In.)
Pipe flow velocity =     14.69(Ft/s)
Travel time through pipe =    0.94 min.
Time of concentration (TC) =    17.05 min.
End of computations, total study area =           43.84 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.

Area averaged pervious area fraction(Ap) = 1.000
Area averaged RI index number =  85.2
```

IRONWOOD PRE-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 2-YEAR, 24-HOUR STORM DURATION
ONSITE AREA "A2"
FILENAME: ARA2EXONSITE

Drainage Area = 29.70(Ac.) = 0.046 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 29.70(Ac.) = 0.046 Sq. Mi.
Length along longest watercourse = 2054.72(Ft.)
Length along longest watercourse measured to centroid = 1192.18(Ft.)
Length along longest watercourse = 0.389 Mi.
Length along longest watercourse measured to centroid = 0.226 Mi.
Difference in elevation = 65.10(Ft.)
Slope along watercourse = 167.2870 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.108 Hr.
Lag time = 6.48 Min.
25% of lag time = 1.62 Min.
40% of lag time = 2.59 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
29.70	2.00	59.40

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
29.70	5.00	148.50

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 2.000(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.000(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
29.700	74.76	0.000

Total Area Entered = 29.70(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
74.8	56.7	0.504	0.000	0.504	1.000	0.504
					Sum (F) =	0.504

Area averaged mean soil loss (F) (In/Hr) = 0.504
Minimum soil loss rate ((In/Hr)) = 0.252
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6279

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

IRONWOOD POST-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 2-YEAR, 24-HOUR STORM DURATION
ONSITE AREA "A2"
FILENAME: ARA2ONSITE

Drainage Area = 29.70(Ac.) = 0.046 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 29.70(Ac.) = 0.046 Sq. Mi.
Length along longest watercourse = 2054.72(Ft.)
Length along longest watercourse measured to centroid = 1192.18(Ft.)
Length along longest watercourse = 0.389 Mi.
Length along longest watercourse measured to centroid = 0.226 Mi.
Difference in elevation = 65.10(Ft.)
Slope along watercourse = 167.2870 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.054 Hr.
Lag time = 3.24 Min.
25% of lag time = 0.81 Min.
40% of lag time = 1.30 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
29.70	2.00	59.40

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
29.70	5.00	148.50

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 2.000(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.000(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
29.700	53.20	0.500

Total Area Entered = 29.70(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
53.2	33.6	0.728	0.500	0.400	1.000	0.400
					Sum (F) =	0.400

Area averaged mean soil loss (F) (In/Hr) = 0.400
Minimum soil loss rate ((In/Hr)) = 0.200
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.500

IRONWOOD PRE-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 2-YEAR, 24-HOUR STORM DURATION
ONSITE AREA "B"
FILENAME: ARBEXONSITE

Drainage Area = 15.65(Ac.) = 0.024 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 15.65(Ac.) = 0.024 Sq. Mi.
Length along longest watercourse = 1881.50(Ft.)
Length along longest watercourse measured to centroid = 959.32(Ft.)
Length along longest watercourse = 0.356 Mi.
Length along longest watercourse measured to centroid = 0.182 Mi.
Difference in elevation = 136.00(Ft.)
Slope along watercourse = 381.6529 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.082 Hr.
Lag time = 4.93 Min.
25% of lag time = 1.23 Min.
40% of lag time = 1.97 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
15.65	2.00	31.30

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
15.65	5.00	78.25

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 2.000(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 2.000(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
15.650	82.47	0.000

Total Area Entered = 15.65(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
82.5	66.5	0.400	0.000	0.400	1.000	0.400
					Sum (F) =	0.400

Area averaged mean soil loss (F) (In/Hr) = 0.400
Minimum soil loss rate ((In/Hr)) = 0.200
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

8	0.667	810.657	1.448	0.228
			Sum = 100.000	Sum= 15.772

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit	Time (Hr.)	Pattern Percent	Storm Rain (In/Hr)	Loss rate(In./Hr) Max	Loss rate(In./Hr) Low	Effective (In/Hr)
1	0.08	0.07	0.016	(0.710)	0.014	0.002
2	0.17	0.07	0.016	(0.707)	0.014	0.002
3	0.25	0.07	0.016	(0.704)	0.014	0.002

IRONWOOD POST-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 2-YEAR, 24-HOUR STORM DURATION
ONSITE AREA "B"
FILENAME: ARBONSITE

Drainage Area = 15.65(Ac.) = 0.024 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 15.65(Ac.) = 0.024 Sq. Mi.
Length along longest watercourse = 1881.50(Ft.)
Length along longest watercourse measured to centroid = 959.32(Ft.)
Length along longest watercourse = 0.356 Mi.
Length along longest watercourse measured to centroid = 0.182 Mi.
Difference in elevation = 136.00(Ft.)
Slope along watercourse = 381.6529 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.041 Hr.
Lag time = 2.47 Min.
25% of lag time = 0.62 Min.
40% of lag time = 0.99 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
15.65	2.00	31.30

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
15.65	5.00	78.25

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 2.000(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 2.000(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
15.650	68.90	0.429

Total Area Entered = 15.65(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
68.9	49.7	0.575	0.429	0.353	1.000	0.353
					Sum (F) =	0.353

Area averaged mean soil loss (F) (In/Hr) = 0.353
Minimum soil loss rate ((In/Hr)) = 0.177
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.557

U n i t   H y d r o g r a p h
VALLEY S-Curve

Unit Hydrograph Data

Unit time period (hrs)		Time % of lag	Distribution Graph %	Unit Hydrograph (CFS)
1	0.083	202.664	43.858	6.917
2	0.167	405.329	43.182	6.811
3	0.250	607.993	8.686	1.370
4	0.333	810.657	4.274	0.674
			Sum = 100.000	Sum= 15.772

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit	Time (Hr.)	Pattern Percent	Storm Rain (In/Hr)	Loss rate(In./Hr) Max	Low	Effective (In/Hr)
1	0.08	0.07	0.016	(0.626)	0.009	0.007

IRONWOOD POST-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 100-YEAR, 1-HOUR STORM DURATION
OFFSITE AREA "A"
FILENAME: ARAOFF

Drainage Area = 30.79(Ac.) = 0.048 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 30.79(Ac.) = 0.048 Sq. Mi.
Length along longest watercourse = 2900.95(Ft.)
Length along longest watercourse measured to centroid = 1549.43(Ft.)
Length along longest watercourse = 0.549 Mi.
Length along longest watercourse measured to centroid = 0.293 Mi.
Difference in elevation = 397.00(Ft.)
Slope along watercourse = 722.5771 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.103 Hr.
Lag time = 6.18 Min.
25% of lag time = 1.55 Min.
40% of lag time = 2.47 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
30.79	2.00	61.58

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
30.79	5.00	153.95

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 5.000(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 5.000(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
30.790	84.20	0.118

Total Area Entered = 30.79(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
84.2	84.2	0.196	0.118	0.175	1.000	0.175
					Sum (F) =	0.175

Area averaged mean soil loss (F) (In/Hr) = 0.175
Minimum soil loss rate ((In/Hr)) = 0.088
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.806

IRONWOOD POST-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 100-YEAR, 1-HOUR STORM DURATION
OFFSITE AREA B
FILENAME: ARBOFF

Drainage Area = 73.03(Ac.) = 0.114 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 73.03(Ac.) = 0.114 Sq. Mi.
Length along longest watercourse = 3313.64(Ft.)
Length along longest watercourse measured to centroid = 2180.67(Ft.)
Length along longest watercourse = 0.628 Mi.
Length along longest watercourse measured to centroid = 0.413 Mi.
Difference in elevation = 387.00(Ft.)
Slope along watercourse = 616.6512 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.127 Hr.
Lag time = 7.63 Min.
25% of lag time = 1.91 Min.
40% of lag time = 3.05 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
73.03	2.00	146.06

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
73.03	5.00	365.15

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 5.000(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.999(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
73.030	82.30	0.044

Total Area Entered = 73.03(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
82.3	82.3	0.218	0.044	0.209	1.000	0.209
					Sum (F) =	0.209

Area averaged mean soil loss (F) (In/Hr) = 0.209
Minimum soil loss rate ((In/Hr)) = 0.105
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.865

IRONWOOD POST-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 100-YEAR, 1-HOUR STORM DURATION
ONSITE AREA "A1"
FILENAME: ARA1ONSITE

Drainage Area = 17.86(Ac.) = 0.028 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 17.86(Ac.) = 0.028 Sq. Mi.
Length along longest watercourse = 1720.36(Ft.)
Length along longest watercourse measured to centroid = 1293.41(Ft.)
Length along longest watercourse = 0.326 Mi.
Length along longest watercourse measured to centroid = 0.245 Mi.
Difference in elevation = 74.00(Ft.)
Slope along watercourse = 227.1153 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.049 Hr.
Lag time = 2.95 Min.
25% of lag time = 0.74 Min.
40% of lag time = 1.18 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
17.86	1.20	21.43

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
17.86	2.50	44.65

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.200(In)
Area Averaged 100-Year Rainfall = 2.500(In)

Point rain (area averaged) = 2.500(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.500(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
17.860	58.70	0.500

Total Area Entered = 17.86(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
58.7	58.7	0.483	0.500	0.266	1.000	0.266
					Sum (F) =	0.266

Area averaged mean soil loss (F) (In/Hr) = 0.266
Minimum soil loss rate ((In/Hr)) = 0.133
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.500

IRONWOOD POST-PROJECT CONDITION HYDROLOGY
UNIT HYDROGRAPH ANALYSIS, 100-YEAR, 1-HOUR STORM DURATION
ONSITE AREA "A1"
FILENAME: ARA1ONSITE

Drainage Area = 17.86(Ac.) = 0.028 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 17.86(Ac.) = 0.028 Sq. Mi.
Length along longest watercourse = 1720.36(Ft.)
Length along longest watercourse measured to centroid = 1293.41(Ft.)
Length along longest watercourse = 0.326 Mi.
Length along longest watercourse measured to centroid = 0.245 Mi.
Difference in elevation = 74.00(Ft.)
Slope along watercourse = 227.1153 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.049 Hr.
Lag time = 2.95 Min.
25% of lag time = 0.74 Min.
40% of lag time = 1.18 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
17.86	2.00	35.72

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
17.86	5.00	89.30

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 2.000(In)
Area Averaged 100-Year Rainfall = 5.000(In)

Point rain (area averaged) = 5.000(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 5.000(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
17.860	58.70	0.500

Total Area Entered = 17.86(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
58.7	58.7	0.483	0.500	0.266	1.000	0.266
					Sum (F) =	0.266

Area averaged mean soil loss (F) (In/Hr) = 0.266
Minimum soil loss rate ((In/Hr)) = 0.133
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.500

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit	Time (Hr.)	Pattern Percent	Storm Rain (In/Hr)	Loss rate(In./Hr) Max	Low	Effective (In/Hr)
1	0.08	0.50	0.150	(0.290)	0.075	0.075
2	0.17	0.60	0.180	(0.290)	0.090	0.090
3	0.25	0.60	0.180	(0.290)	0.090	0.090
4	0.33	0.60	0.180	(0.290)	0.090	0.090
5	0.42	0.60	0.180	(0.290)	0.090	0.090
6	0.50	0.70	0.210	(0.290)	0.105	0.105
7	0.58	0.70	0.210	(0.290)	0.105	0.105
8	0.67	0.70	0.210	(0.290)	0.105	0.105
9	0.75	0.70	0.210	(0.290)	0.105	0.105
10	0.83	0.70	0.210	(0.290)	0.105	0.105
11	0.92	0.70	0.210	(0.290)	0.105	0.105
12	1.00	0.80	0.240	(0.290)	0.120	0.120
13	1.08	0.80	0.240	(0.290)	0.120	0.120
14	1.17	0.80	0.240	(0.290)	0.120	0.120
15	1.25	0.80	0.240	(0.290)	0.120	0.120
16	1.33	0.80	0.240	(0.290)	0.120	0.120
